

CSE 232 Advanced Software Engineering

# NAZAMLY

*The Ultimate sports tournament manager*

## PROJECT DOCUMENTATION

**Submitted to:**

Prof. Dr. Gamal Abdel Shafy

Eng. Sally Shaker

**Submitted by:**

Youssef George Fouad                  19P9824

Mostafa Nasrat Metwally                  19P4619

Kerollos Wageeh Youssef                  19P3468

Anthony Amgad Fayek                  19P9880

## **0. Abstract**

The name alongside the logo truly reflects the webapp main function, which will be discussed in the document, in addition to the youthful identity of the project written in a fresh font to represent the dynamic, competitive energy of the sports industry.

*Figure 1: Nazamly Logo*

It is a webapp that is set to be able to help in planning, organizing in addition to following up with any sport tournament of any organizational plan, sport, or number of participants.

# **1. Introduction**

## ***1.1. Purpose***

This document is created so that there is no miss communication between the software development team and the intended party that requested the development of the software product, as it entails all the details of the software which are explained and visualized using various tools like UML Diagrams and charts. In addition to that, this document contains details of the plan going forward with development which includes all the steps that will be taken as well as the financial aspect and the different ways the user can practically use the product.

## ***1.2. List of Definitions***

- **API** (Application Programming Interface)

A specific method prescribed by an application program by which a programmer writing an application program can make requests of the operating system or another application.

- **Gantt Chart:**

A horizontal chart frequently used in project management that provides a graphical illustration of a schedule that helps to plan, coordinate, and track specific tasks in a project.

- **IDE** (Integrated Development Environment)

a programming environment that has been packaged as an application program, typically consisting of a code editor, a compiler, a debugger, and a GUI builder.

- **KLOC** (Thousands of Lines of Code)

A traditional measure of how large a computer program is or how long or how many people it will take to write it, sometimes used as a rough measure of programmer productivity.

- **SDK** (Software Development Kit)

A set of programs used by a computer programmer to write application programs.

- **UI** (User Interface)

Everything designed into an information device with which a human being may interact -- including display screen, keyboard, mouse, light pen, the appearance of a desktop, illuminated characters, help messages, and how an application program or a Web site invites interaction and responds to it.

### **1.3. Scope**

Nazamly is an online webapp that is set to be able to help in planning, organizing in addition to following up with any sport tournament of any organizational plan, sport, or number of participants. The software is a tournament organization tool that can be used by various parties in communicating tournament details among many people that include match dates, contestants, scores, and venues. It also has the option of letting users buy or sell tickets if a venue is available for use.

Tournify is a website that has similar features and goals like that of Nazamly. They have over 30,000 users ranging from amateurs to professionals. They have also partnered with famous football clubs such as Ajax and Chelsea. This goes to show the potential of the Nazamly app in the Egyptian market. In addition to that, what separates Nazamly from Tournify is the follow up feature, as Tournify only allows the participants of a tournament to see its progress unlike Nazamly which will show any interested user any tournament's progress and any match results.

### **1.4. List of References**

#### **1) [Angular 13](#)**

Angular is a TypeScript-based free and open-source web application framework led by the Angular Team at Google and by a community of individuals and corporations.

#### **2) [Ng Bootstrap Libraries](#)**

Angular widgets built from the ground up using only Bootstrap 4 CSS with APIs designed for the Angular ecosystem.

#### **3) [GitHub](#)**

A provider of software development, distributed version control, and source code management functionality using Git.

*Project source code available at: [Nazamly GitHub Repository](#)*

#### **4) MS Visio**

Microsoft Visio is a diagramming and vector graphics application and is part of the Microsoft Office family.

#### **5) Lucidchart**

A web-based proprietary platform that allows users to collaborate on drawing, revising and sharing charts and diagrams.

#### **6) Visual Studio Code**

An IDE made by Microsoft for Windows, Linux and macOS, and was used to write this application code.

## **1.5. Overview**

This document is a part of the full Nazamly project. It aims to discuss the detailed, full process and help you understand the architecture, interface, capability, and ability of the Nazamly software system.

It helps answer questions of the software architect, engineer, and developer concerning how the journey of building the system took place from day one till the deployment and delivery of the web application. In addition, it gives business-related people and investors some insights about the plan, cost estimation, and potential profit and growth. Moreover, it provides the end-user with the know-how of using the system to have the best possible experience.

## **2. General Description**

### **2.1. Product Perspective**

The product acts as the bridge that merges the gap between casual sports players, tournament organizers, and fans away from the professional athletic world. It offers a solution platform where an organizer can schedule a community tournament and allow the fans to follow their favorite teams playing in their community tournaments and buy tickets too to attend these matches, paying in cash or using cards.

### **2.2. General Capabilities**

The system can generate matches schedule, calculate teams points, organize tickets selling, and allow fans to sign up for a free-to-create account to customize their experience as true fans of their community teams.

### **2.3. General Constraints**

The web application should have a user-friendly graphical interface that allows him to interact easily with the system and enjoy the best possible customized experience in simple, appropriate English language.

### **2.4. User Characteristics**

In this section, the different user roles are described where, Nazamly webapp is expected to have three type of users, anonymous users that have not signed up for an account in addition to the logged in users that have already sign up to the platform, besides the admin users that have chosen to have the organizers' privileges when creating their Nazamly app.

Firstly, anonymous users can sign up to a make a new account or view any details about any tournament ranging from scores to player details without being able to buy tickets or follow certain team.

Secondly, registered users, who have an account but are not organizers, have added benefits than an anonymous user that include, selecting their favorite teams for a more personalized experience, and the ability to purchase tickets to any available match.

Last but not least, organizing users will be able to use all available features of the application that include creating new tournaments and managing them by entering matches' scores and players info.

## ***2.5. Environment Description***

The webapp's operational environment is intended to be like any other web application software system that requires a web browser and a stable internet connection in order to fully operate and function properly.

## ***2.6. Assumptions and Dependencies***

The system assumes the regular user has some basic knowledge about how sports tournaments work in terms of match making, scoring, and pointing system in addition to general sports related English terms. It is also assumed that the user has access to internet on any device with an internet browser already installed.

### **3. Specific Requirements**

#### **3.1. Capability Requirements**

##### **1- Sign up**

The website visitor shall register for one of two account types, normal user or a tournament organizer user to enjoy special features.

##### **2- Create a new tournament**

A tournament organizer shall be able to create a new tournament and the system should generate a matches' timetable as per the input conditions.

##### **3- Add/ Update match final score**

A tournament organizer shall be able to update a match final score.

##### **4- Select favorite teams to follow**

Registered users shall select their favorite teams to follow their latest and upcoming matches on their home screen.

##### **5- View matches**

All users shall view matches of any team played in any tournament in any time.

##### **6- Filter viewed matches**

All users shall be able to filter viewed matches by date, team or tournament.

##### **7- Buy tickets**

Registered users shall be able to buy tickets for any upcoming match.

##### **8- Generate sales report**

Tournament organizers shall be able to generate sales report.

##### **9- View players' statistics**

Any user shall view players' goals statistics and filter them according to tournament.

##### **10- View tournaments league standings**

All users shall view a tournament standing of any tournament in any time.

##### **11- Sort tournament's view**

All users shall be able to sort viewed tournament standings, ascendingly or descendingly, by several filters, including position, goals for count, goals against count, goals difference, and matches played count.

### ***3.2. Constraint Requirements***

- 1- The system needs an internet connection to be functional.
- 2- The program shall have a user-friendly interface so that its easier for any user to be able use.
- 3- The program shall have a 50-millisecond response time.
- 4- The program shall not contain any inappropriate content; sexual, violent, bullying, or racist.
- 5- The passwords should be securely saved and will not be accessed by anyone.
- 6- The program shall be safe from any attacks or attempts of hacking.

## 4. Use-Case Diagram

A use case diagram establishes the capability of the system from the user's point of view including several components:

- 1- **Actors:** anonymous user, registered normal user, registered organizer user.
- 2- **Use cases:** represented by blue ovals in figure 1.
- 3- **System boundary:** represented by a rectangular frame.
- 4- **Use cases' relationships:** extend, include, inheritance.
- 5- **Actors' relationships.**

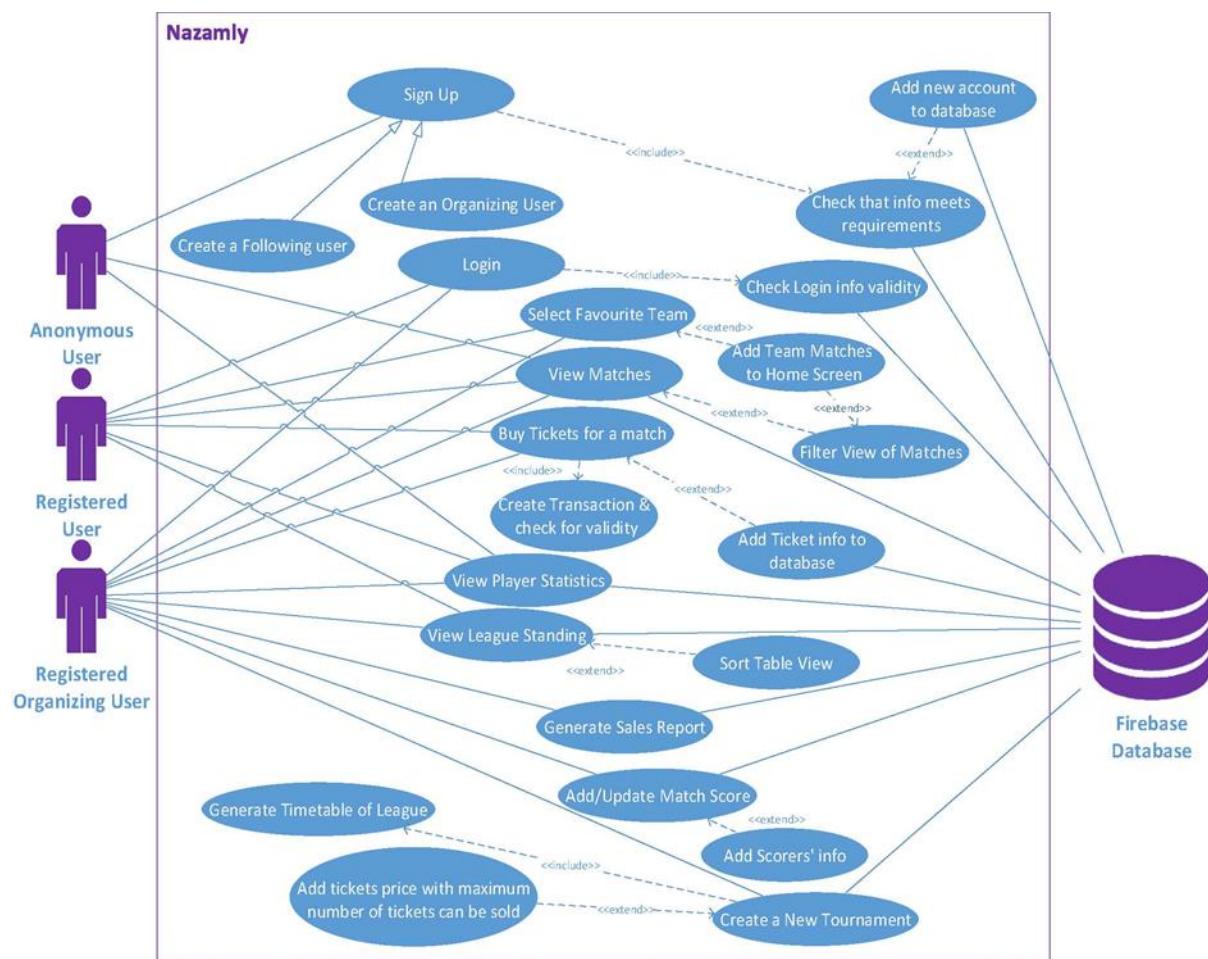

Figure 2: Use-Case Diagram

## 1- Sign Up

<b>Use Case Name</b>	Sign up	
<b>Related Requirements</b>	Requirement 1.	
<b>Goal In Context</b>	A new user registers for a new user account.	
<b>Preconditions</b>	The user registers with a new email.	
<b>Successful End Condition</b>	A new user account is created.	
<b>Failed End Condition</b>	The request is rejected.	
<b>Primary Actors</b>	Anonymous user.	
<b>Secondary Actors</b>	Firebase Database	
<b>Trigger</b>	The user fills in the new account form.	
<b>Included Cases</b>	Check that provided information meets requirements.	
<b>Main Flow</b>	<b>Step</b>	<b>Action</b>
	1	The user requests to register for a new account.
	2	The user fills in the required personal information.
	3	The user's details are verified using the credentials' authentication database system. <b>include:: check info meets req.</b>
	4	A new account is created.
	5	A success message pops up.
<b>Extensions</b>	<b>Step</b>	<b>Branching Action</b>
	3.1	The credentials' authentication database system refuses the user's personal information.
	3.2	The request is rejected, and an error message pops.

2- Check that provided information meets requirements.

<b>Use Case Name</b>	Check that provided information meets requirements.	
<b>Related Requirements</b>	Requirement 1.	
<b>Goal In Context</b>	A new account details need to be checked and verified.	
<b>Preconditions</b>	The user submits a new user request.	
<b>Successful End Condition</b>	A new user account is verified.	
<b>Failed End Condition</b>	The new account request is rejected.	
<b>Primary Actors</b>	Firebase Database.	
<b>Secondary Actors</b>	None.	
<b>Trigger</b>	The new user information is provided to the system.	
<b>Included Cases</b>	Add new account to database.	
<b>Main Flow</b>	<b>Step</b>	<b>Action</b>
	1	The new user information is provided to the system.
	2	The credentials' database authentication system verifies the details are not of another existing account and that all requirements meet the specifications.
	3	The user's details are verified.
	4	A new account is added to the users' database.
	5	A success message pops up.
<b>Extensions</b>	<b>Step</b>	<b>Branching Action</b>
	3.1	The details are rejected for duplication or inaccuracy.
	4.1	No new account added due to rejection of user's information.

### 3- Add new account to database

<b>Use Case Name</b>	Add new account to database.	
<b>Related Requirements</b>	Requirement 1.	
<b>Goal In Context</b>	Add new account information to database records.	
<b>Preconditions</b>	The authentication system verifies the new user information.	
<b>Successful End Condition</b>	A new user account is added.	
<b>Failed End Condition</b>	The new account request is not added.	
<b>Primary Actors</b>	Firebase Database.	
<b>Secondary Actors</b>	None.	
<b>Trigger</b>	The new user information is verified and accepted by the database.	
<b>Base Case(s)</b>	Check that provided information meets requirements.	
Main Flow	Step	Action
	1	The new user information is accepted by the credentials' database authentication system.
	2	All user information details are added to the database records.

#### 4- Login

<b>Use Case Name</b>	Log in	
<b>Related Requirements</b>	Requirement 2.	
<b>Goal In Context</b>	A registered user logs in to his account.	
<b>Preconditions</b>	The user has an account.	
<b>Successful End Condition</b>	The user logs in his account.	
<b>Failed End Condition</b>	The user does not log in his account.	
<b>Primary Actors</b>	Registered user – Registered organizer account.	
<b>Secondary Actors</b>	Firebase Database	
<b>Trigger</b>	The user fills in his login credentials.	
<b>Included Cases</b>	Check login information validity	
<b>Main Flow</b>	<b>Step</b>	<b>Action</b>
	1	The user fills in his username and password.
	2	The provided credentials are verified using the credentials' authentication database system. <b>include:: check login validity</b>
	3	The user logs in his account.
	4	The user returns to his customized home page.
<b>Extensions</b>	<b>Step</b>	<b>Branching Action</b>
	2.1	The credentials' authentication database system refuses the provided credentials.
	3.2	Login fails, and a specified error message pops.

## 5- Check log in validity

<b>Use Case Name</b>	Check login validity								
<b>Related Requirements</b>	Requirement 2.								
<b>Goal In Context</b>	A registered user logs in to his account.								
<b>Preconditions</b>	The user attempts to log in.								
<b>Successful End Condition</b>	Login credentials verified.								
<b>Failed End Condition</b>	Login credentials verification failed.								
<b>Primary Actors</b>	Firebase Database								
<b>Secondary Actors</b>	None								
<b>Trigger</b>	The user fills in his login credentials.								
<b>Main Flow</b>	<table border="1"> <thead> <tr> <th>Step</th> <th>Action</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>The database system is provided user credentials.</td> </tr> <tr> <td>2</td> <td>Check whether email and password match.</td> </tr> <tr> <td>3</td> <td>Return success message</td> </tr> </tbody> </table>	Step	Action	1	The database system is provided user credentials.	2	Check whether email and password match.	3	Return success message
Step	Action								
1	The database system is provided user credentials.								
2	Check whether email and password match.								
3	Return success message								
<b>Extensions</b>	<table border="1"> <thead> <tr> <th>Step</th> <th>Branching Action</th> </tr> </thead> <tbody> <tr> <td>3.1</td> <td>Email and password do not match.</td> </tr> <tr> <td>3.2</td> <td>Return error message.</td> </tr> </tbody> </table>	Step	Branching Action	3.1	Email and password do not match.	3.2	Return error message.		
Step	Branching Action								
3.1	Email and password do not match.								
3.2	Return error message.								

## 6- Select favorite team

<b>Use Case Name</b>	Select favorite team.	
<b>Related Requirements</b>	Requirement 5.	
<b>Goal In Context</b>	Add a team to user's favorite teams list to customize his experience.	
<b>Preconditions</b>	The user is logged in to his account.	
<b>Successful End Condition</b>	User's favorite teams list updated.	
<b>Failed End Condition</b>	User's favorite teams list not updated.	
<b>Primary Actors</b>	Registered user – Registered organizer account.	
<b>Secondary Actors</b>	Firebase Database.	
<b>Trigger</b>	The user selects an existing team to add to his list.	
<b>Included Cases</b>	Add team matches to home screen.	
<b>Main Flow</b>	<b>Step</b>	<b>Action</b>
	1	The user selects team name from a team list including the teams that are not already in his custom favorite teams list.
	2	The team is added to his list. <b>include:: Add team matches to home screen</b>
	3	Home page matches are updated
<b>Extensions</b>	<b>Step</b>	<b>Branching Action</b>
	2.1	Retrieve added team matches and add to home screen.

## 7- Add team matches to home screen

<b>Use Case Name</b>	Add team matches to home screen.	
<b>Related Requirements</b>	Requirement 6.	
<b>Goal In Context</b>	Add teams matches to the application “Home” or “All matches” screen.	
<b>Preconditions</b>	Teams’ list received is not empty.	
<b>Successful End Condition</b>	Matches are retrieved from database.	
<b>Failed End Condition</b>	No matches found in database.	
<b>Primary Actors</b>	Firebase database.	
<b>Secondary Actors</b>	Any user	
<b>Base Case(s)</b>	Add team matches to home screen – Filter view of matches.	
<b>Main Flow</b>	<b>Step</b>	<b>Action</b>
	1	Teams’ list is provided to fetch for their matches.
	2	Matches’ list is retrieved from the database according to the teams’ list.
	3	Matches’ list is sent to be viewed on screen.
<b>Extensions</b>	<b>Step</b>	<b>Branching Action</b>
	2.1	No matches are found for any of the list’s teams.

## 8- Filter view of matches

<b>Use Case Name</b>	Filter view of Matches.	
<b>Related Requirements</b>	Requirements 6, 7.	
<b>Goal In Context</b>	Choose specific filters for matches to view.	
<b>Preconditions</b>	None.	
<b>Successful End Condition</b>	Found matches conforming user's filters.	
<b>Failed End Condition</b>	No matches found conforming user's filters.	
<b>Primary Actors</b>	Any user.	
<b>Secondary Actors</b>	Firebase Database	
<b>Trigger</b>	The user edits the view matches' filter.	
<b>Included Cases</b>	View matches	
<b>Main Flow</b>	Step	Action
	1	The user edits any of the date, team, or tournament filters.
	2	Database system fetches the match conforming the received filters.
	3	The matches' list is retrieved from the database to be viewed on the user's screen.
	4	Viewed matches are updated.
<b>Extensions</b>	Step	Branching Action
	2.1	No matches found according to the set filters.

## 9- View matches

<b>Use Case Name</b>	View matches.	
<b>Related Requirements</b>	Requirement 6.	
<b>Goal In Context</b>	View match cards including date, time, teams name and score.	
<b>Preconditions</b>	None.	
<b>Successful End Condition</b>	Matches viewed in the form of match cards list.	
<b>Failed End Condition</b>	No matches are viewed.	
<b>Primary Actors</b>	Any user.	
<b>Secondary Actors</b>	Firebase Database	
<b>Included Cases</b>	Filter view matches	
Main Flow	Step	Action
	1	Matches' list received from any other module.
	2	Matches data are formatted to a match card format including teams name, score, date, and time.
	3	Match cards are listed on user's screen.

## 10- Buy tickets for a match

<b>Use Case Name</b>	Buy tickets for a match.	
<b>Related Requirements</b>	Requirement 8.	
<b>Goal In Context</b>	Sell match tickets to a registered user.	
<b>Preconditions</b>	User logged in his account.	
<b>Successful End Condition</b>	User gets his ticket(s).	
<b>Failed End Condition</b>	Ticket not sold.	
<b>Primary Actors</b>	External bank servers, registered user.	
<b>Secondary Actors</b>	None.	
<b>Included cases</b>	Create transaction & check validity	
<b>Main Flow</b>	<b>Step</b>	<b>Action</b>
	1	User selects match and number of tickets
	2	Database check if number of tickets required is more than or equal available tickets for this match.
	3	Total price is viewed on the screen.
	4	User chooses cash or credit card payment. <b>include:: Create transaction &amp; check validity</b>
	5	Payment validated and success payment message received.
	6	User gets a PDF file includes all tickets details.
<b>Extensions</b>	<b>Step</b>	<b>Branching Action</b>
	2.1	Tickets required are more than available.
	2.2	Error message that the quantity chosen is not available.
	2.3	User reattempts a smaller number.
	4.1	Transaction rejected.
	4.2	User reattempts payment using another payment method.

## 11- Create transaction and check for validity

<b>Use Case Name</b>	Create transaction and check for validity.	
<b>Related Requirements</b>	Requirements 8.	
<b>Goal In Context</b>	Complete the payment process to buy tickets.	
<b>Preconditions</b>	User chooses to pay online by credit/debit card.	
<b>Successful End Condition</b>	Transaction completed.	
<b>Failed End Condition</b>	Transaction refused.	
<b>Primary Actors</b>	External bank servers, registered user.	
<b>Secondary Actors</b>	None.	
<b>Trigger</b>	The user attempts tickets purchase and provides credit/debit card info.	
<b>Base Case(s)</b>	Buy tickets for a match.	
<b>Main Flow</b>	<b>Step</b>	<b>Action</b>
	1	Credit/debit card information received.
	2	Information sent to bank servers to complete transaction.
	3	Success message received.
	4	Success message sent to the user.
<b>Extensions</b>	<b>Step</b>	<b>Branching Action</b>
	3.1	Transaction refused message received.

## 12- View player statistics

<b>Use Case Name</b>	View players statistics.	
<b>Related Requirements</b>	Requirements 10.	
<b>Goal In Context</b>	View goal scorers' statistics to the users.	
<b>Preconditions</b>	None.	
<b>Successful End Condition</b>	Players' details displayed.	
<b>Failed End Condition</b>	No data displayed.	
<b>Primary Actors</b>	Any user.	
<b>Secondary Actors</b>	Firebase database.	
<b>Trigger</b>	None.	
<b>Included cases</b>	None.	
<b>Main Flow</b>	Step	Action
	1	Fetch players' data from database.
	2	Players' data are formatted to a player card format including his name, number of goals, team, and tournament names.
	3	Match cards are listed on user's screen.
<b>Extensions</b>	Step	Branching Action
	1.1	No players' data found.

### 13- View league standings

<b>Use Case Name</b>	View league standings.	
<b>Related Requirements</b>	Requirements 11.	
<b>Goal In Context</b>	View league standings to the users.	
<b>Preconditions</b>	None.	
<b>Successful End Condition</b>	League standings displayed.	
<b>Failed End Condition</b>	League standings not displayed.	
<b>Primary Actors</b>	Any user.	
<b>Secondary Actors</b>	Firebase database.	
<b>Trigger</b>	User chooses league name to view its standings.	
<b>Included cases</b>	None.	
<b>Main Flow</b>	<b>Step</b>	<b>Action</b>
	1	Fetch teams' list of the selected tournament from database.
	2	Sort teams' list according to points account, if two of them have equal number of points, refer to the goals difference.
	3	Display all teams' details in a table view.
<b>Extensions</b>	<b>Step</b>	<b>Branching Action</b>
	1.1	No teams found in database.
	1.2	Display error message.

## 14- Generate Sales Report

<b>Use Case Name</b>	Generate sales report.	
<b>Related Requirements</b>	Requirement 9.	
<b>Goal In Context</b>	Generate sales report for a tournament organizer.	
<b>Preconditions</b>	The user organizes a tournament.	
<b>Successful End Condition</b>	A sales report is generated.	
<b>Failed End Condition</b>	A sales report is not generated.	
<b>Primary Actors</b>	An organizing user.	
<b>Secondary Actors</b>	Firebase database.	
<b>Included cases</b>	None.	
Main Flow	Step	Action
	1	Tournament organizer selects a tournament.
	2	Retrieve matches and tickets lists of the selected tournament from the database.
	3	Calculate sales for each match in addition to total tournament sales
	4	Create a sales formatted PDF files.
	5	Tabulate calculated sales info.
	6	Open the PDF file for the user to view or save.

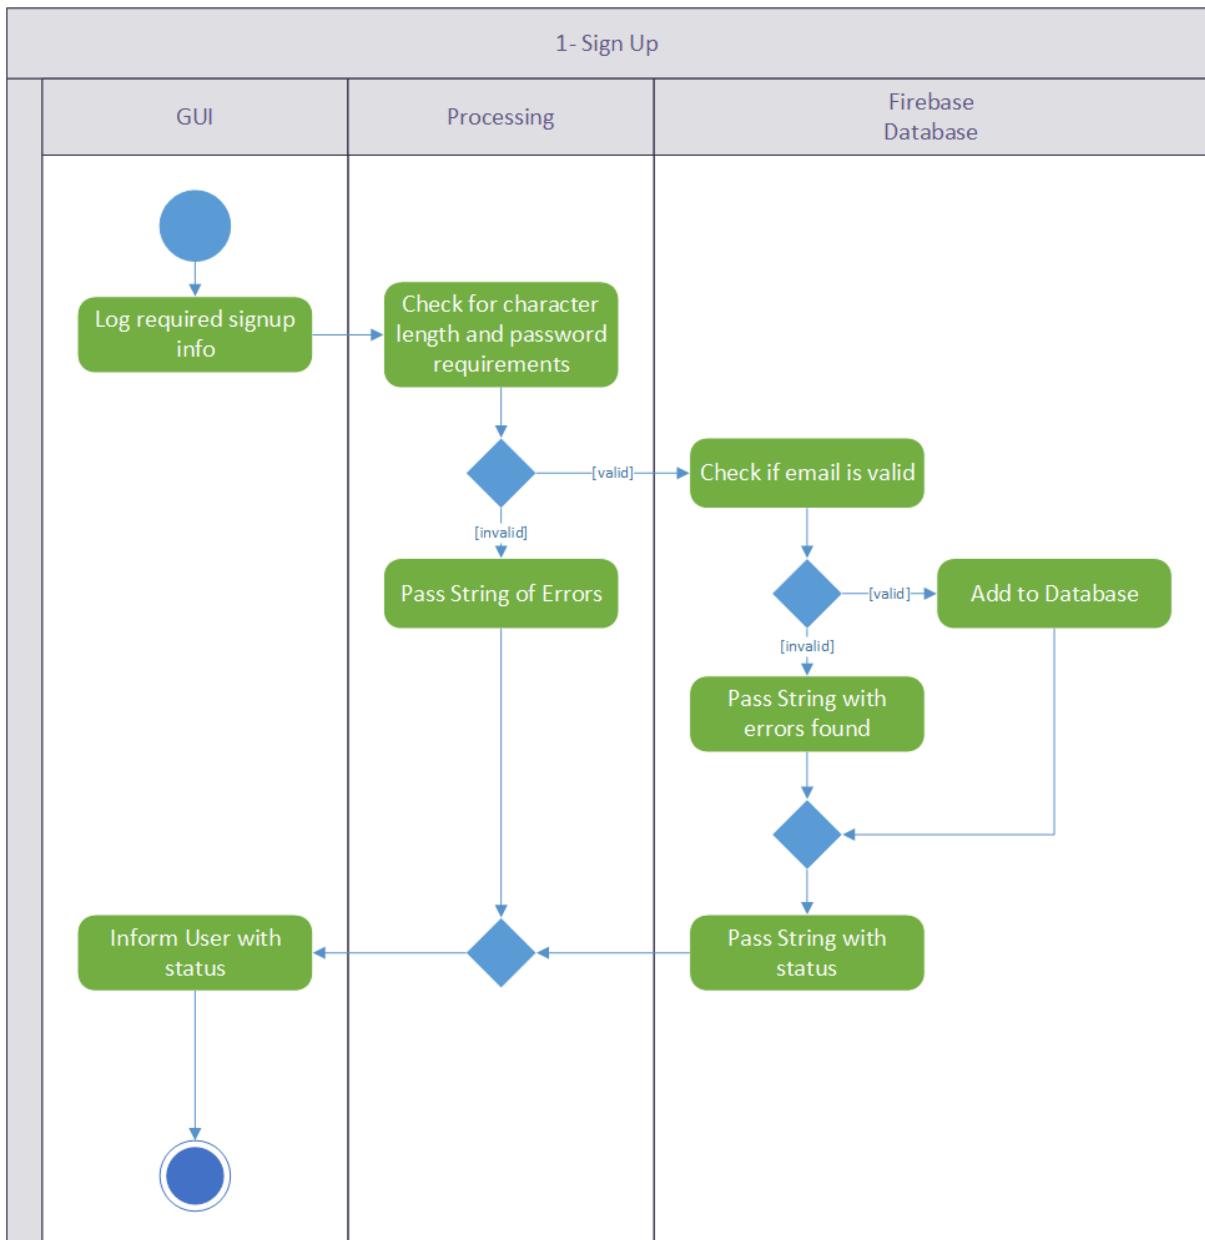

## 15- Add/update match score

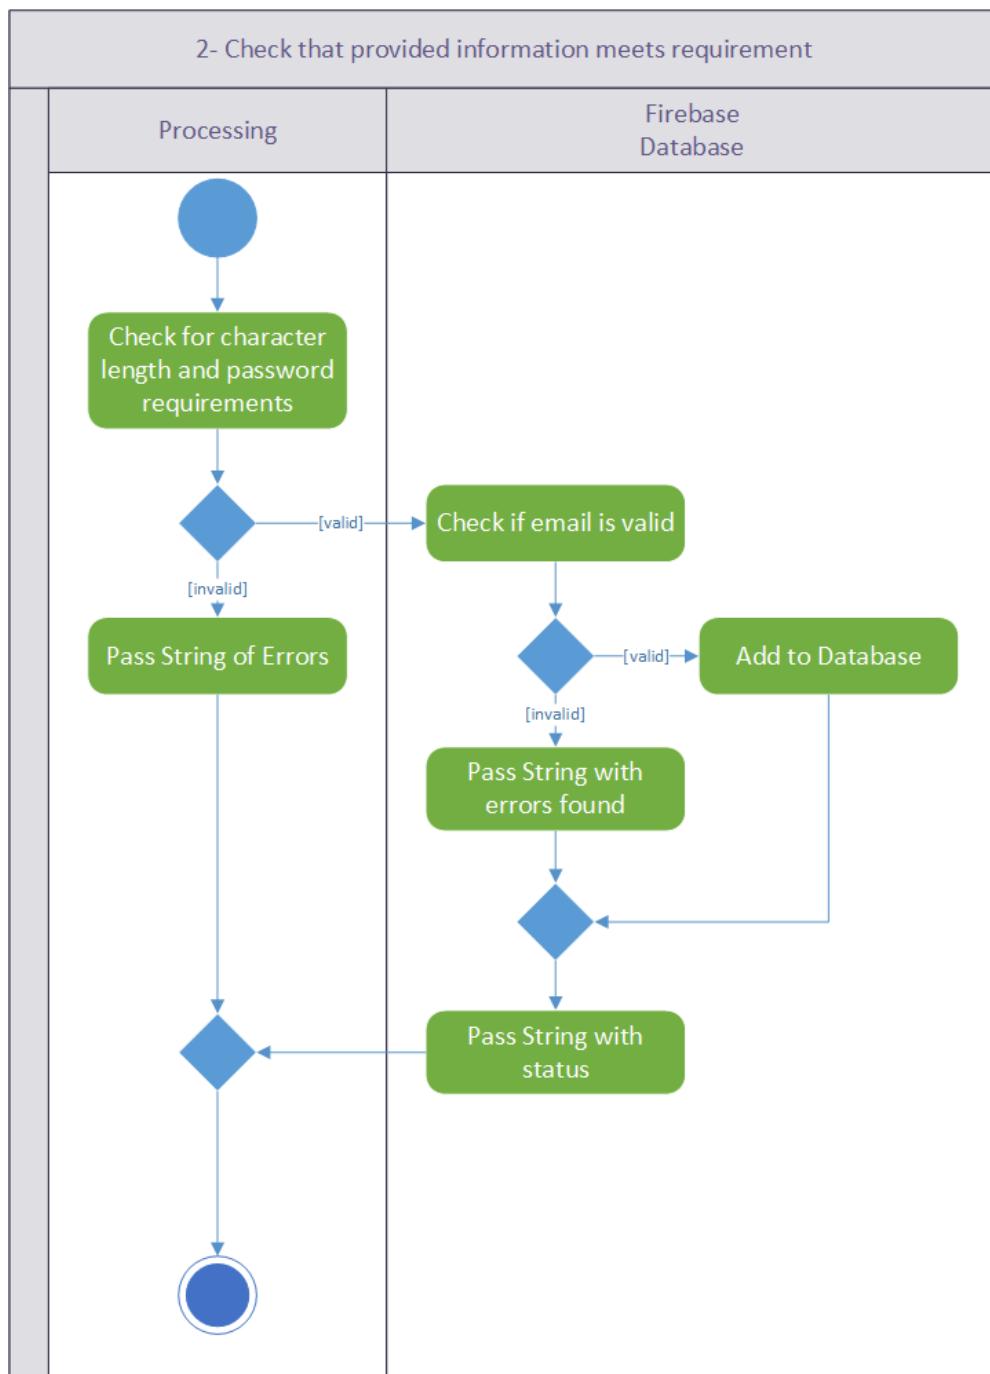

<b>Use Case Name</b>	Add/update match score.	
<b>Related Requirements</b>	Requirement 4.	
<b>Goal In Context</b>	Update match details after it has been played.	
<b>Preconditions</b>	The user organizes a tournament.	
<b>Successful End Condition</b>	Match final score updated.	
<b>Failed End Condition</b>	Match final score not updated.	
<b>Primary Actors</b>	An organizing user.	
<b>Secondary Actors</b>	Firebase database.	
<b>Included cases</b>	Add scorers' info.	
<b>Main Flow</b>	<b>Step</b>	<b>Action</b>
	1	Tournament organizer selects a tournament.
	2	Retrieve matches and players names lists of the selected tournament from the database.
	3	Organizer chooses the match he wants to update.
	4	Organizer enters the match final score. <b>include:: Add scorers' info</b>
	5	Match final score updated.
<b>Extensions</b>	<b>Step</b>	<b>Branching Action</b>
	1.1	Selected Tournament does not have any match left not played.
	2.1	Selected match has a final score assigned to it.
	4.1	User selects of the already existing players or add a new one to assign a goal to him/her.

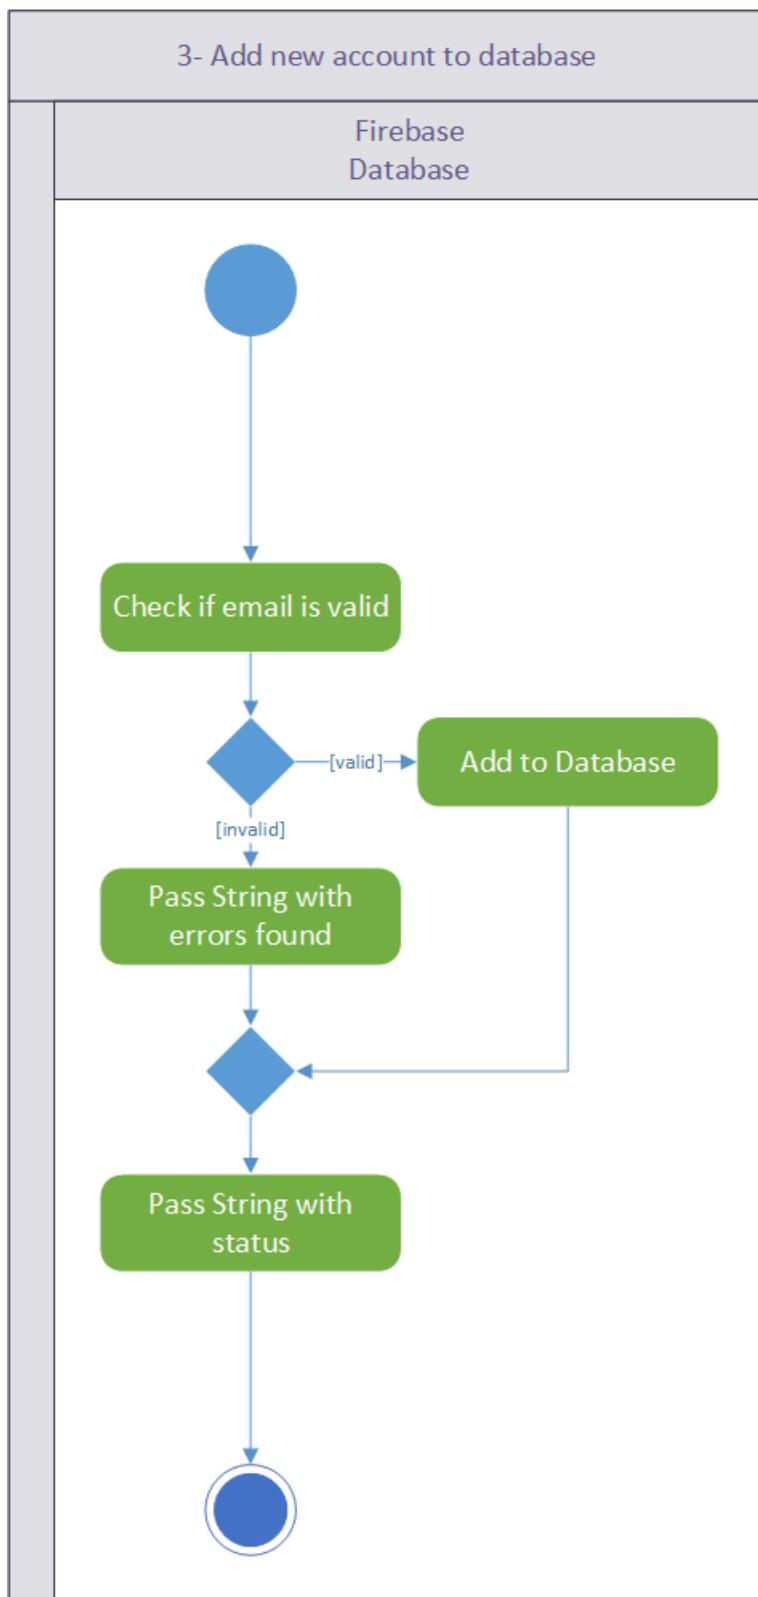

## 16- Create new tournament

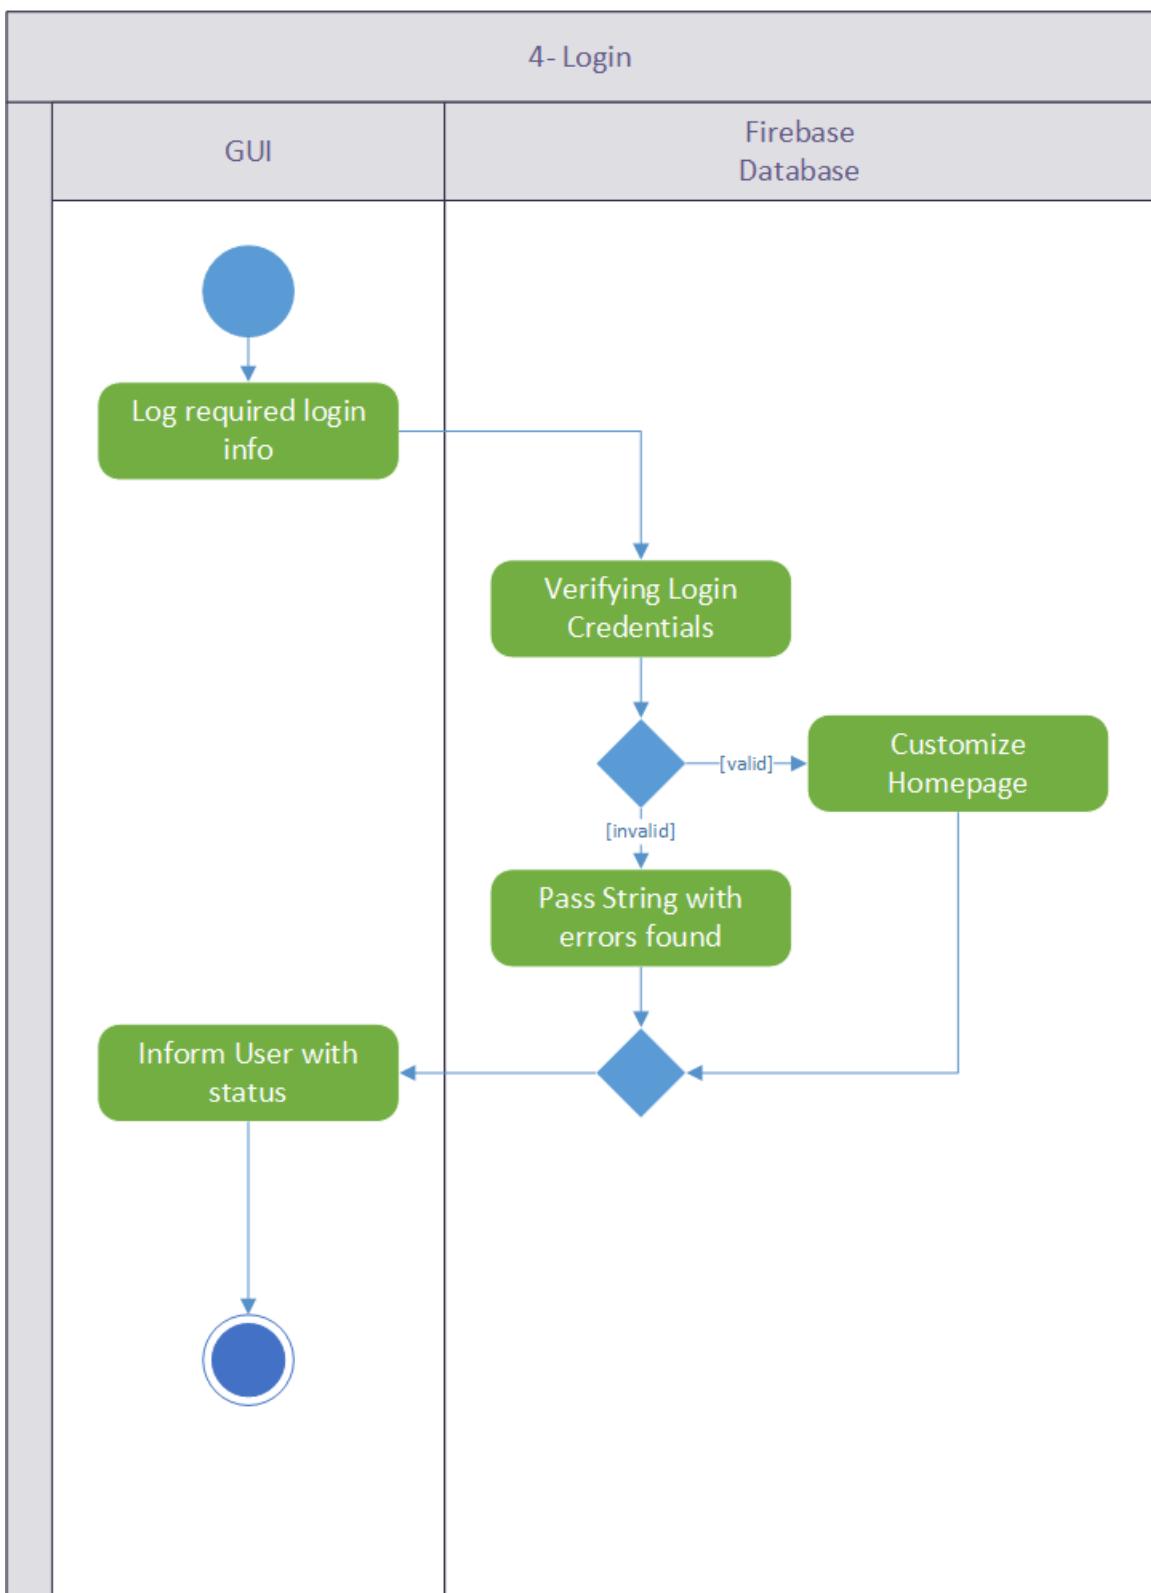

<b>Use Case Name</b>	Create new tournament.	
<b>Related Requirements</b>	Requirement 3.	
<b>Goal In Context</b>	Organizer add a new tournament to the system.	
<b>Preconditions</b>	The user account is an organizer account.	
<b>Successful End Condition</b>	A new tournament added to the system.	
<b>Failed End Condition</b>	No tournaments added to the system.	
<b>Primary Actors</b>	An organizing user.	
<b>Secondary Actors</b>	Firebase database.	
<b>Included cases</b>	Generate timetable of league – Add tickets info	
<b>Main Flow</b>	<b>Step</b>	<b>Action</b>
	1 <b>include:: Add tickets info</b>	Tournament organizer enters tournament details including, tournament name, teams count, teams' names, time frame, and number of legs.
	2 <b>include:: Generate timetable</b>	A timetable is generated specifying matches weeks, opponents, date, and time.
	3	Tournament and matches details added to the database.
	4	Success label pops up indicating the creation of a new tournament.
<b>Extensions</b>	<b>Step</b>	<b>Branching Action</b>
	1.1	Error message due to similarity between new tournament and other tournaments names.
	2.1	Error message due to time interval is negative where the start date comes after the finish date

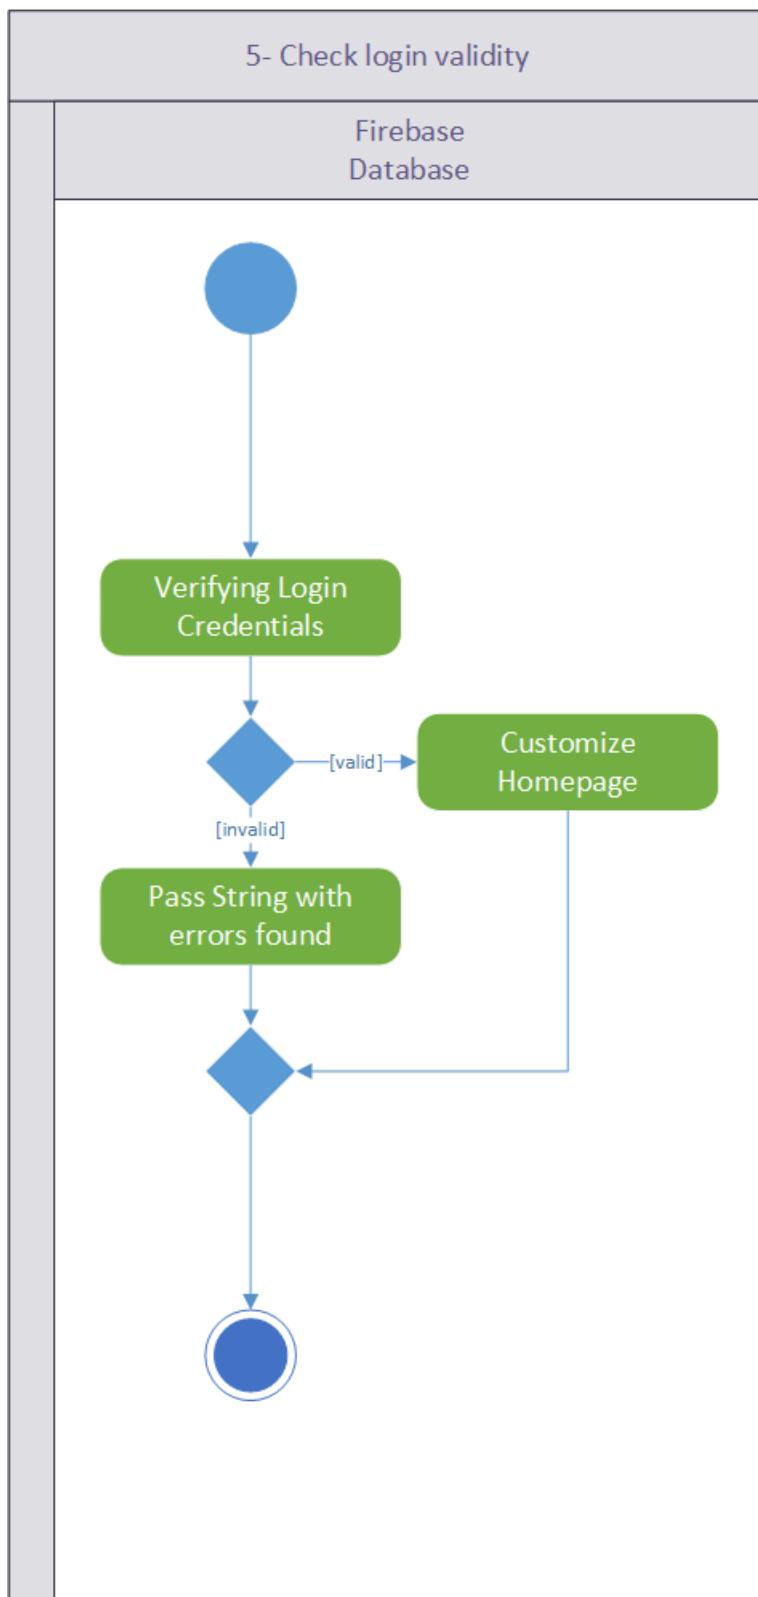

## 5. Swimlane Diagrams

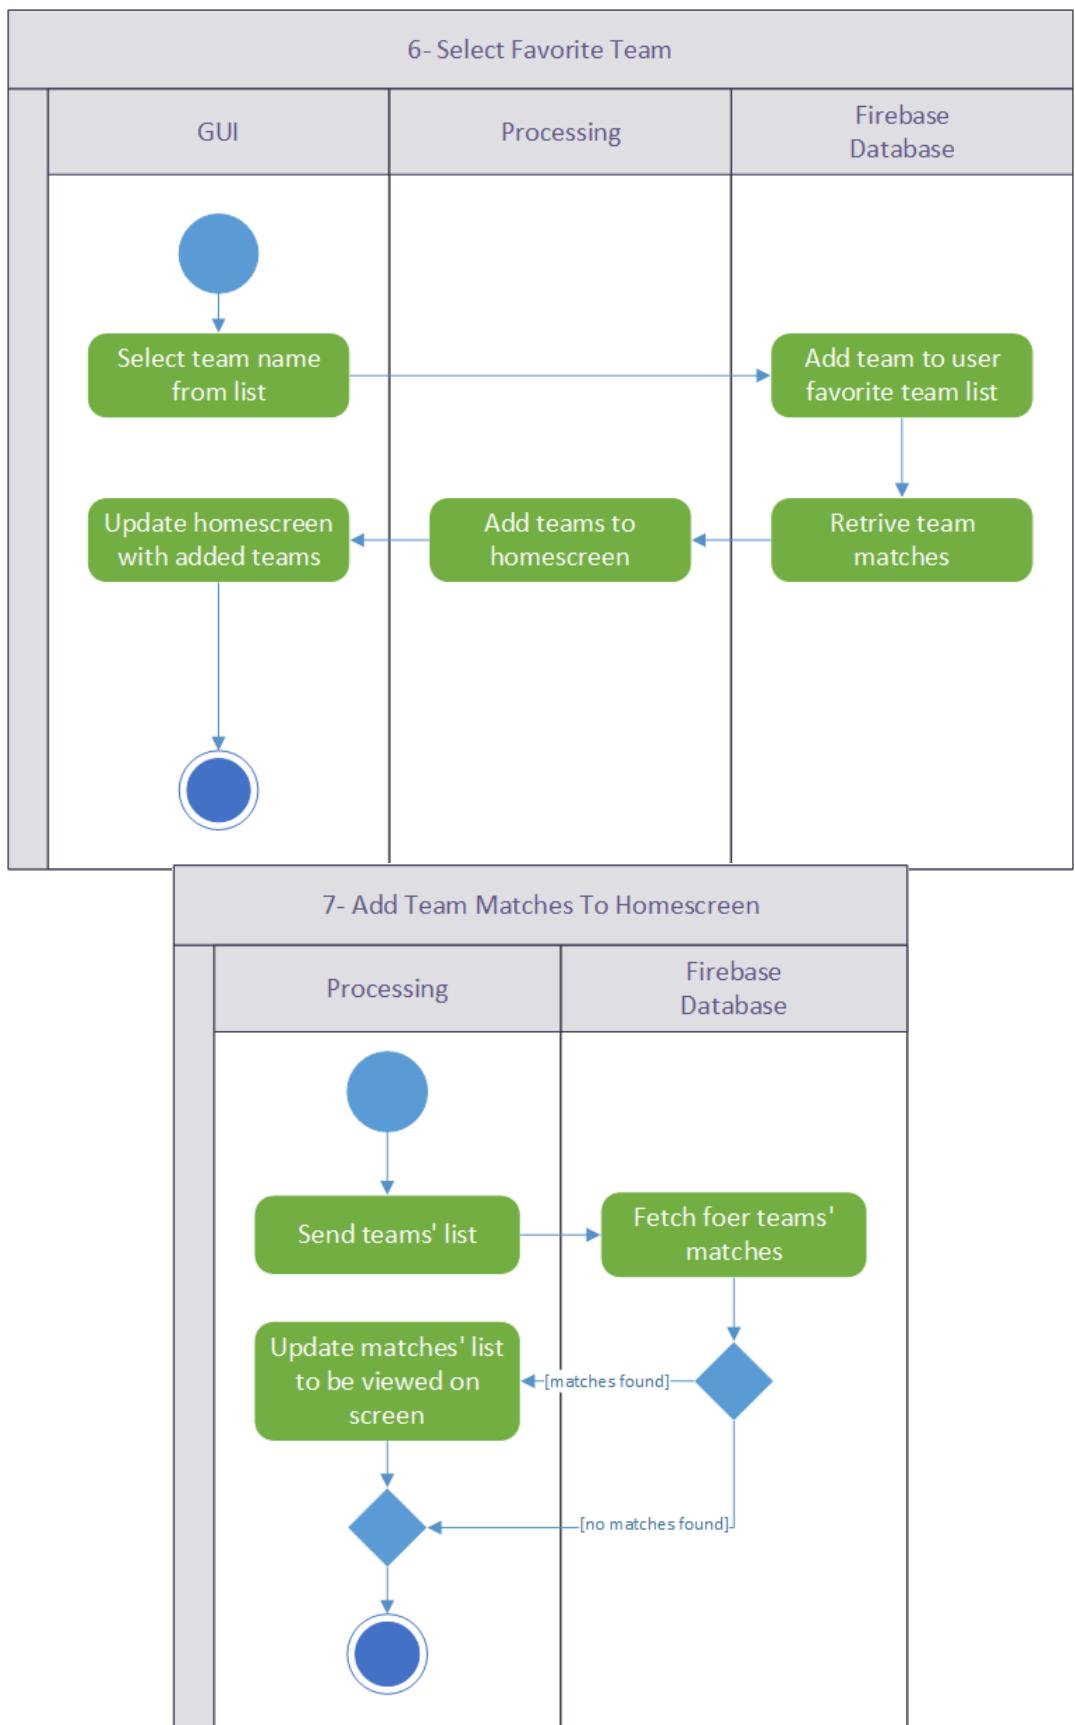

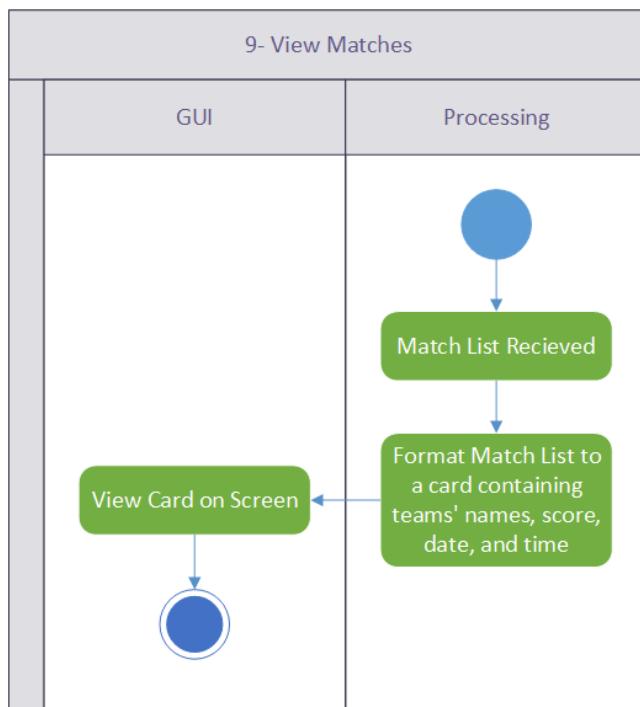

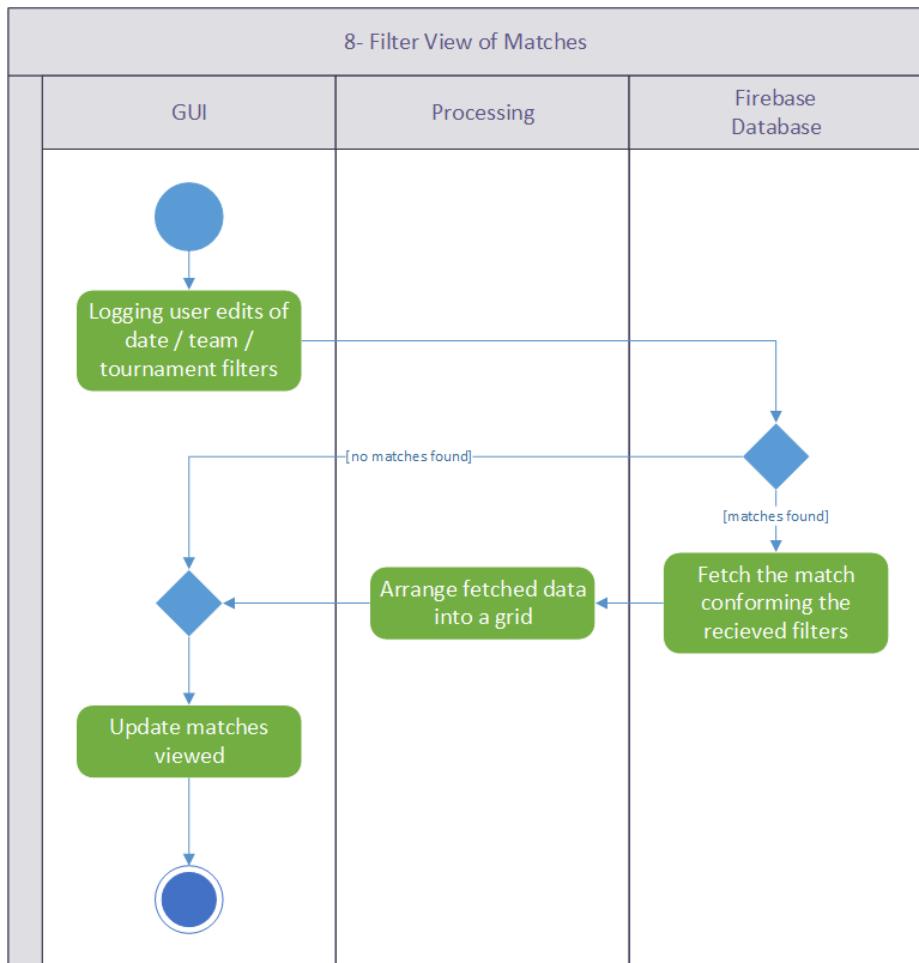

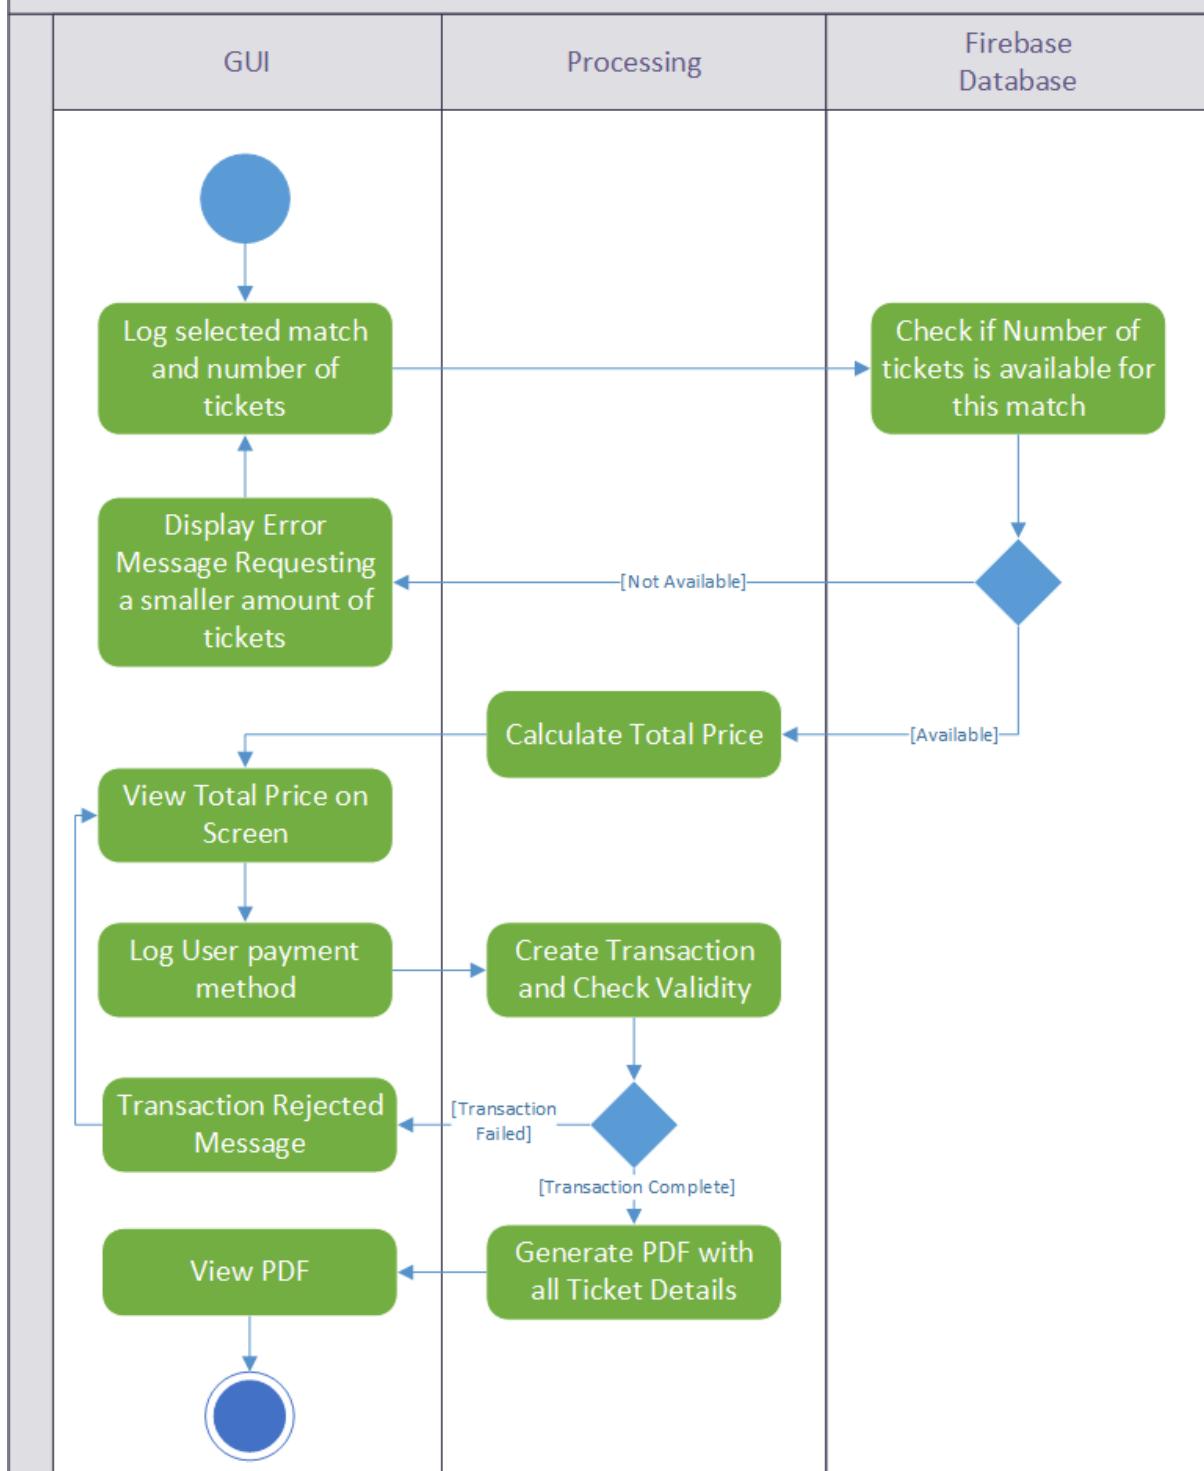

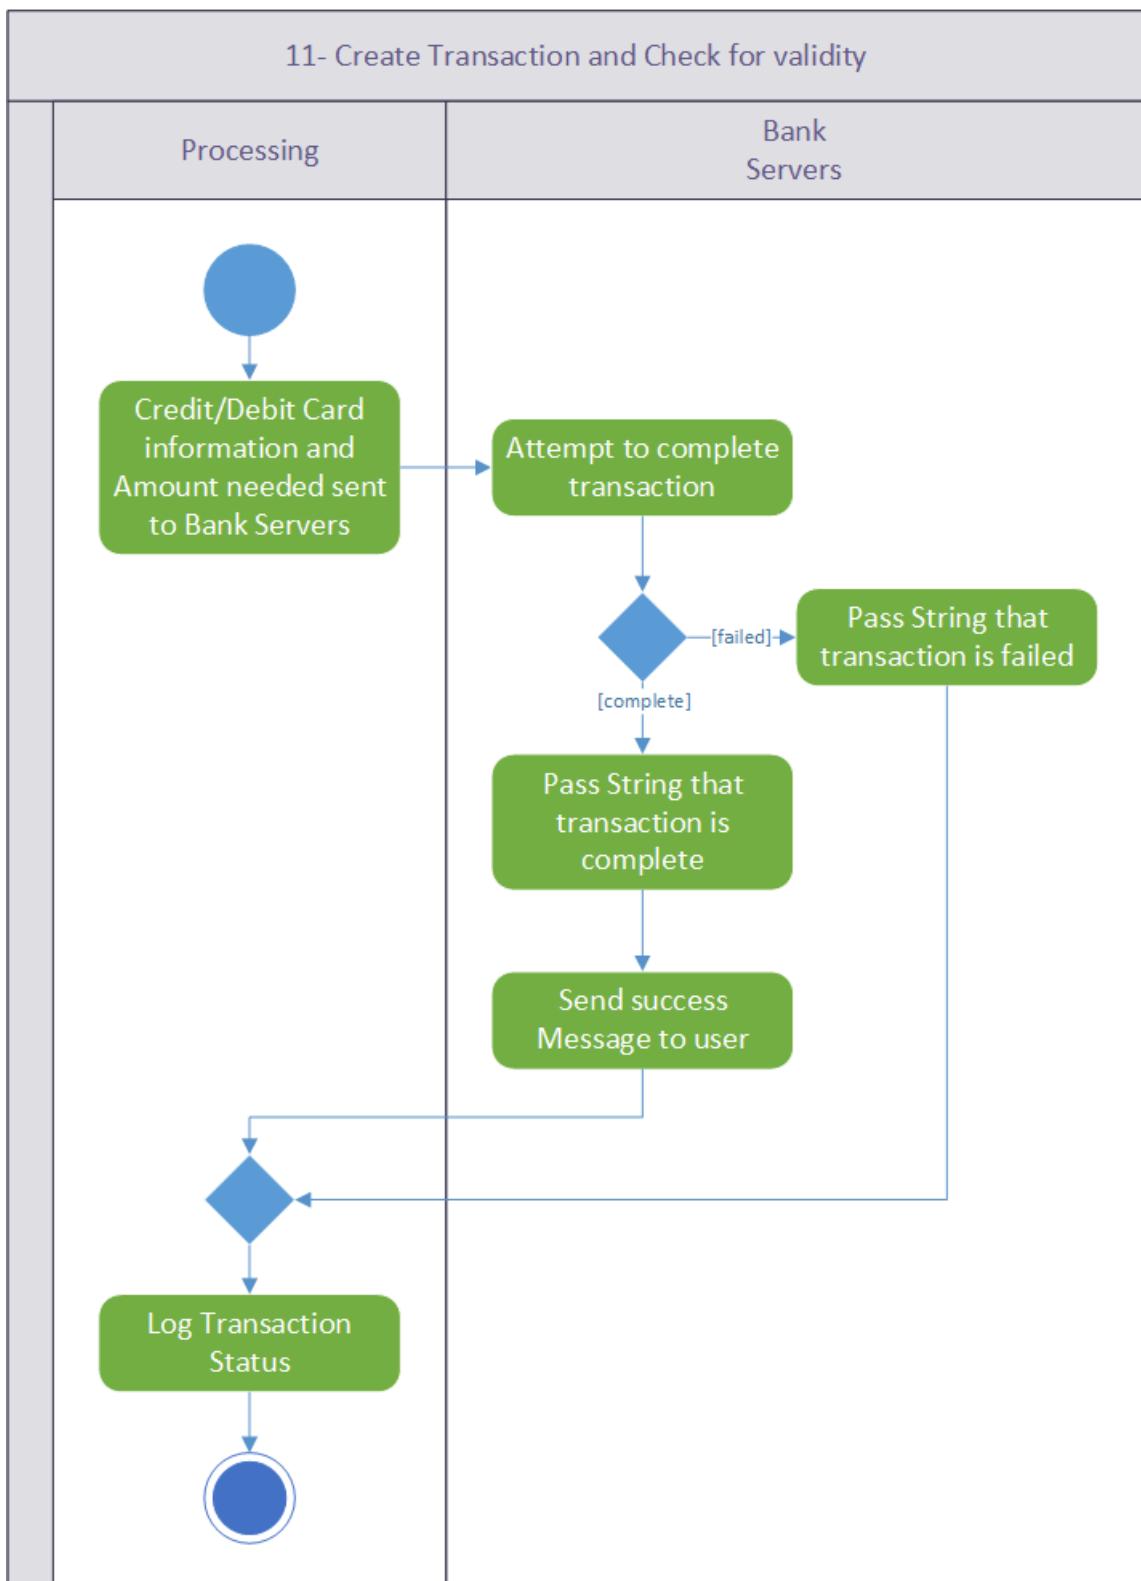

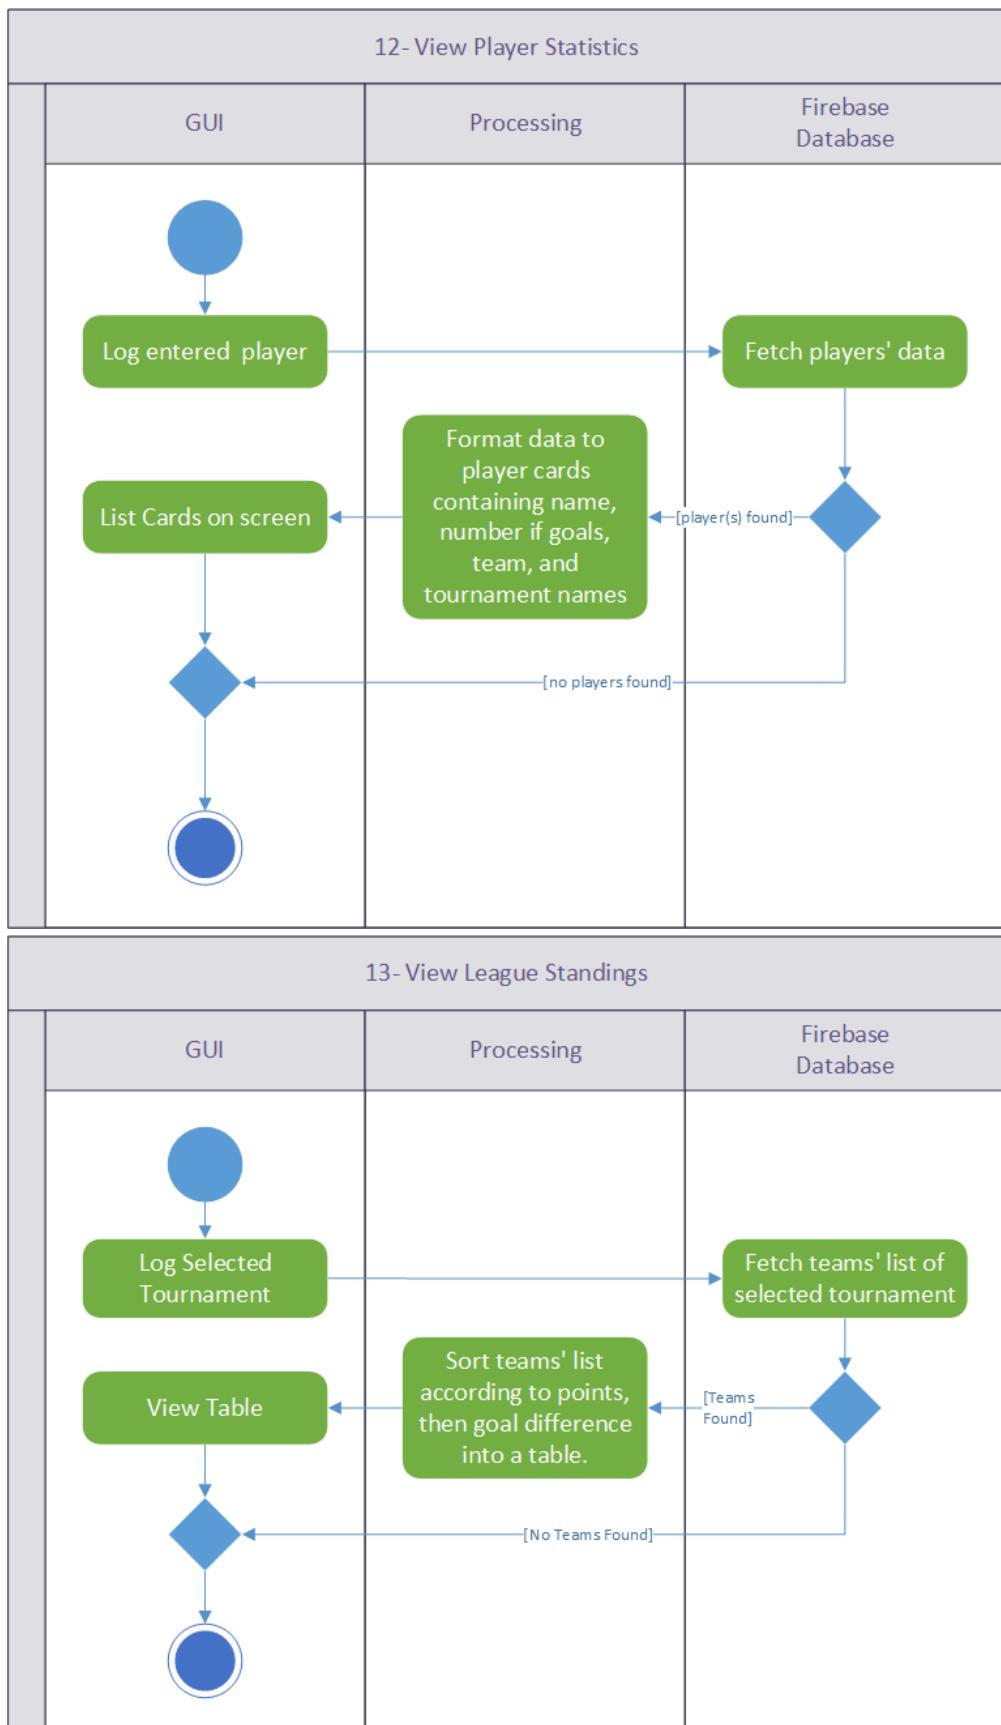

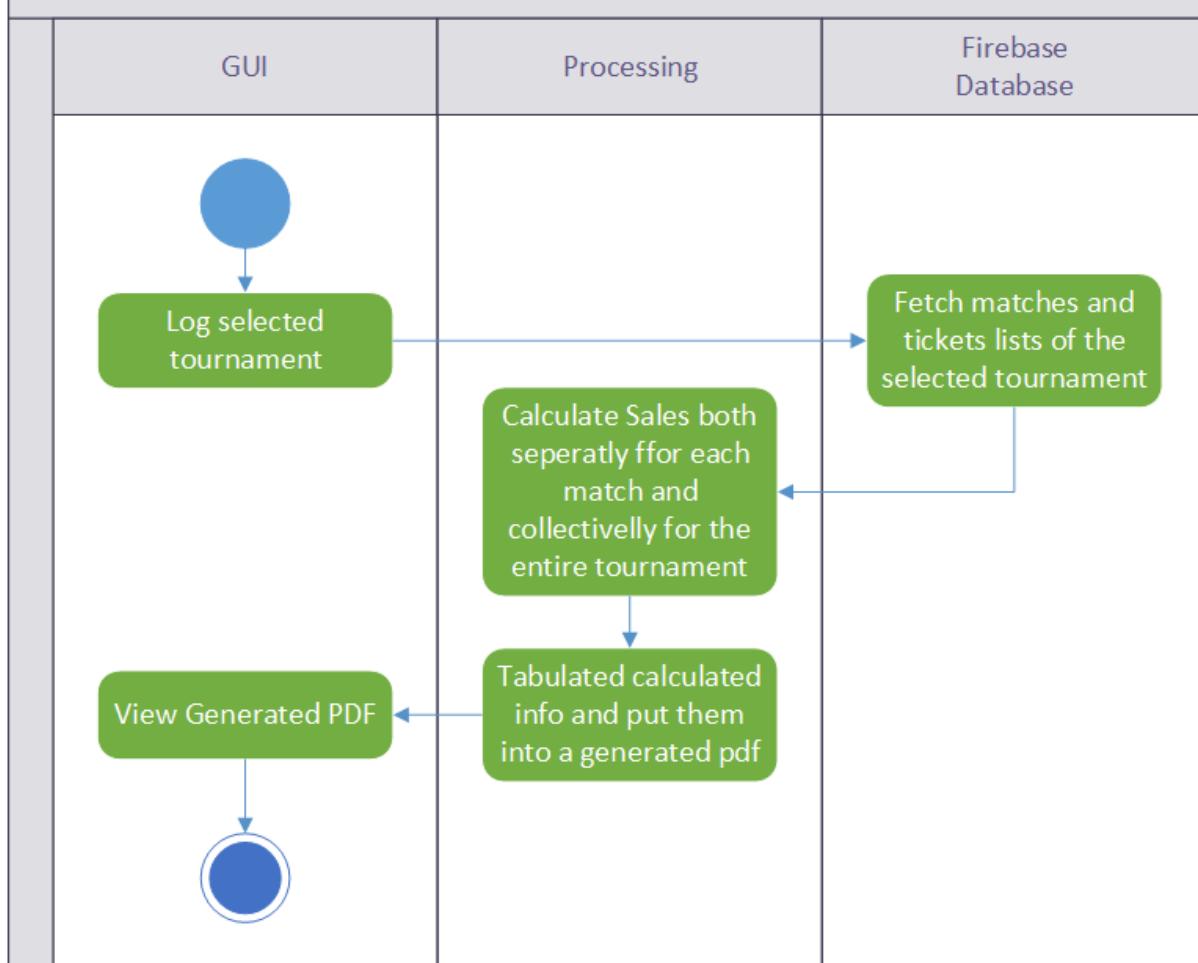

## 10- Buy Tickets For a Match

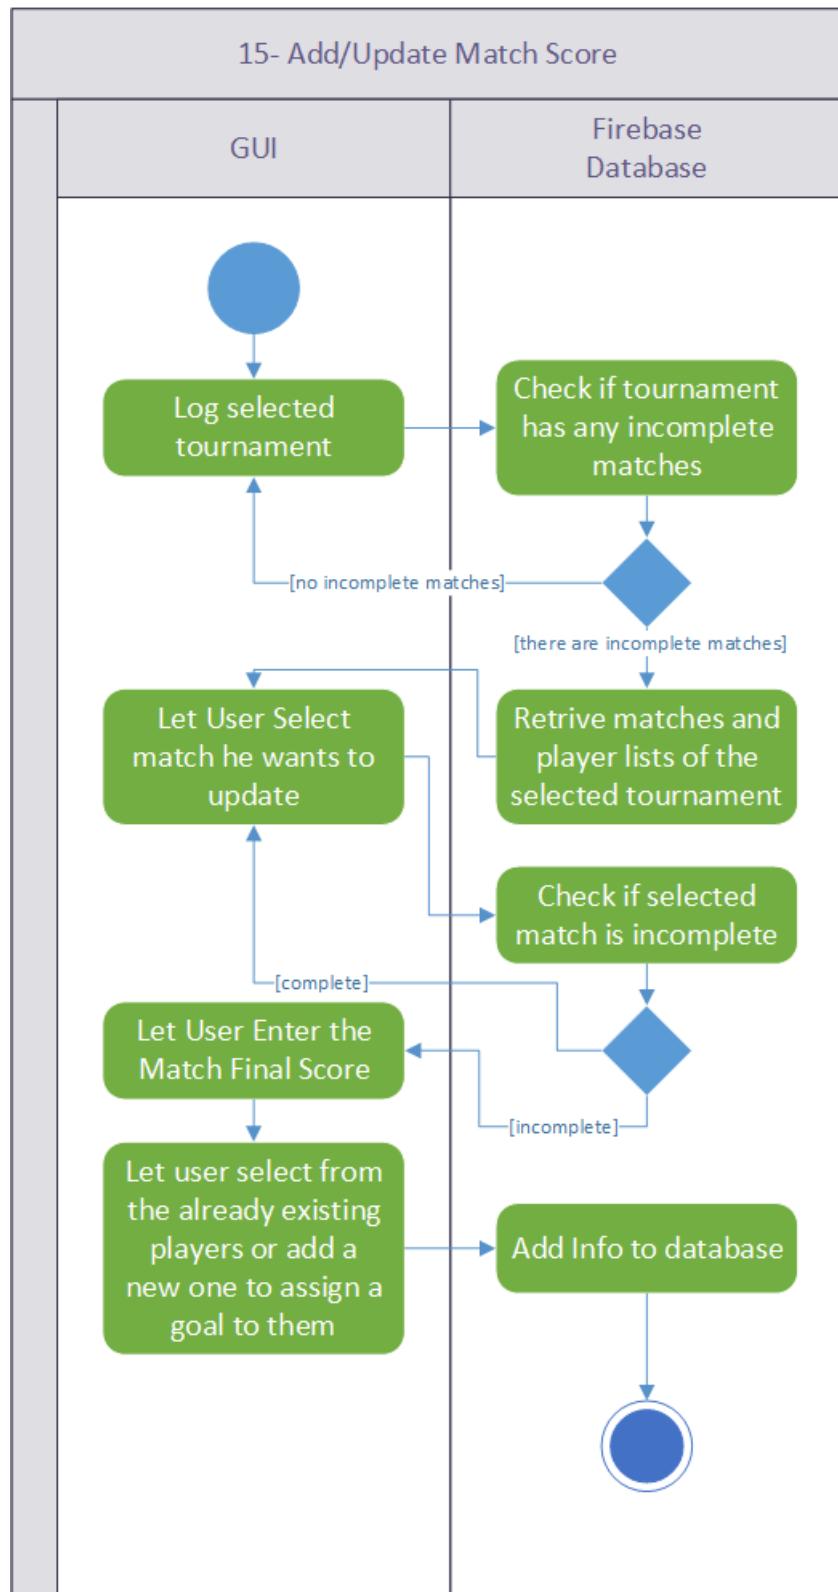

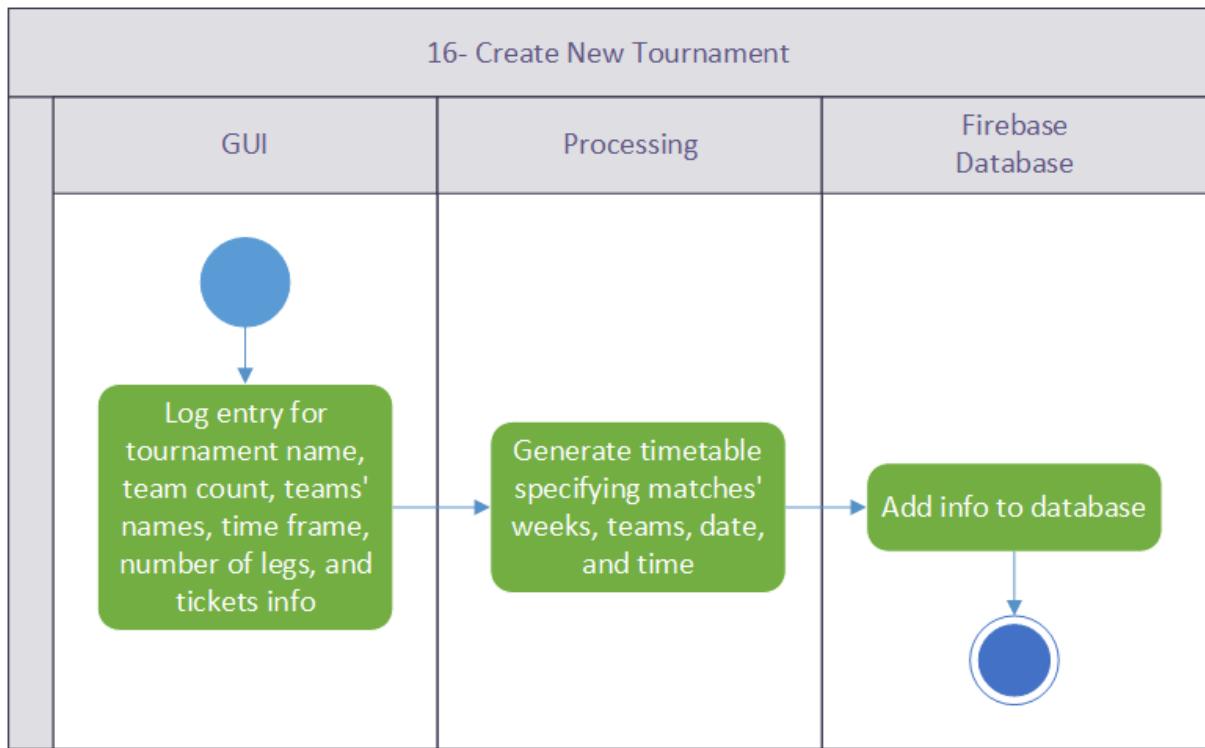

#### 14- Generate Sales Report

## **6. Noun Extraction and CRC Cards**

### **6.1. Noun Extraction Method**

#### **Problem Definition**

“Admin users can create and manage tournaments, add teams, and edit match scores; while normal users can follow teams and tournaments, view match scores and player stats, and buy tickets. You must be a registered user to add your favorite teams, view tournament standings, or buy match tickets either by cash or credit card. When an organizer user adds a team to his tournament, the team admin must accept this invitation to be added to this tournament. All users including anonymous can view match scores, goal scorers, and player stats. Finally, all registered users can edit some of their account info.”

#### **All Identified Nouns:**

*Admin User, Tournament, Team, Match Score, Player Stats, Tickets, Cash, Credit Card, Registered User, Match Tickets, Team Admin, Invitation, Goal, Account Info*

#### **Excluded Nouns:**

*Cash, Credit Card* as they lie outside the problem boundary.

*Invitation, Goal* has no physical existence.

*Admin User, Normal user* can be subclasses for an abstract class *User*

*Match Score, Player Stats, Match Ticket, and Team Admin* are actually attributes for the classes *Match, Player, Match, and Team* respectively.

#### **Extracted Nouns:**

*User (Admin User & Registered User), Tournament, Team, Match, Player, Ticket*

## 6.2. CRC Cards Method

Figure 3: CRC cards

## 7. Class Model

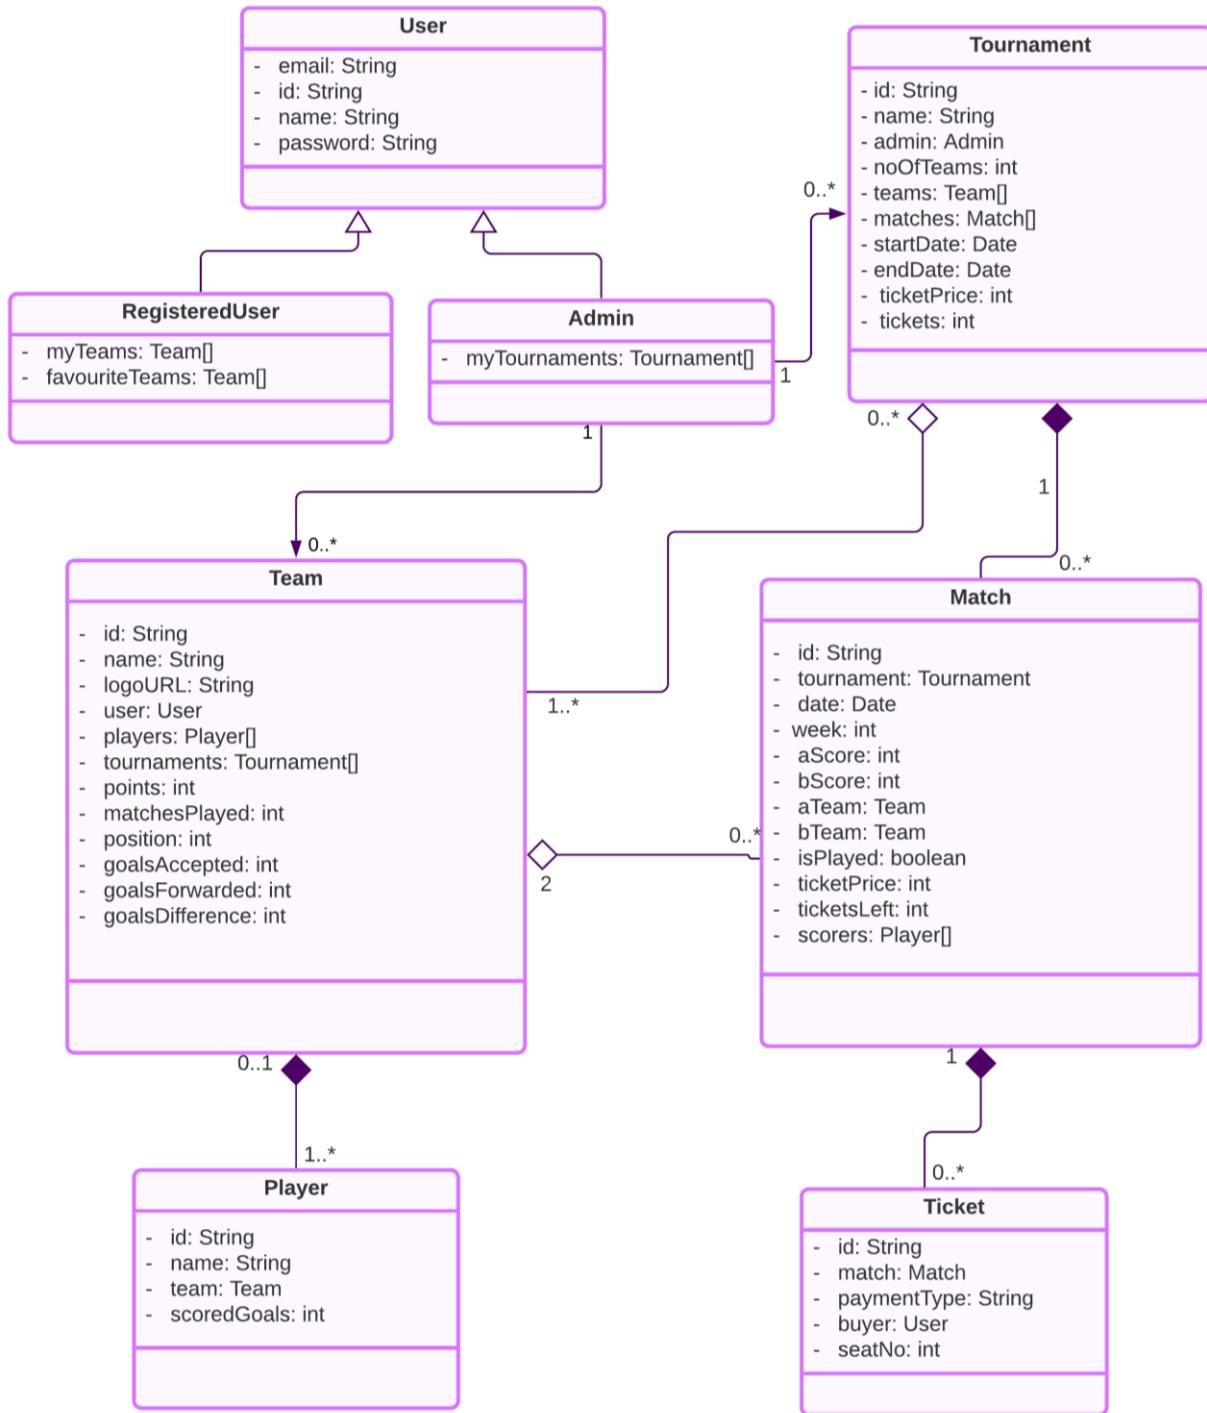

Figure 4: Class Model

The UML class model of this system, shown in Figure 4 clearly demonstrates all the classes, their relationships, and their attributes. Initially, noun extraction method was used to determine the potential classes for this system, then CRC cards was used to determine possible class members and the relations between them.

## 8. State Diagram

The detailed state diagram for the whole system, provided in Figure 23, shows a sequence of states the NAZAMLY system can assume during its lifetime, together with the stimuli that cause those changes between every one of the different states starting from the initial start of the system, symbolled by a circle at the top left of the diagram, until the different possible end states, symbolled using 2 centered circles.

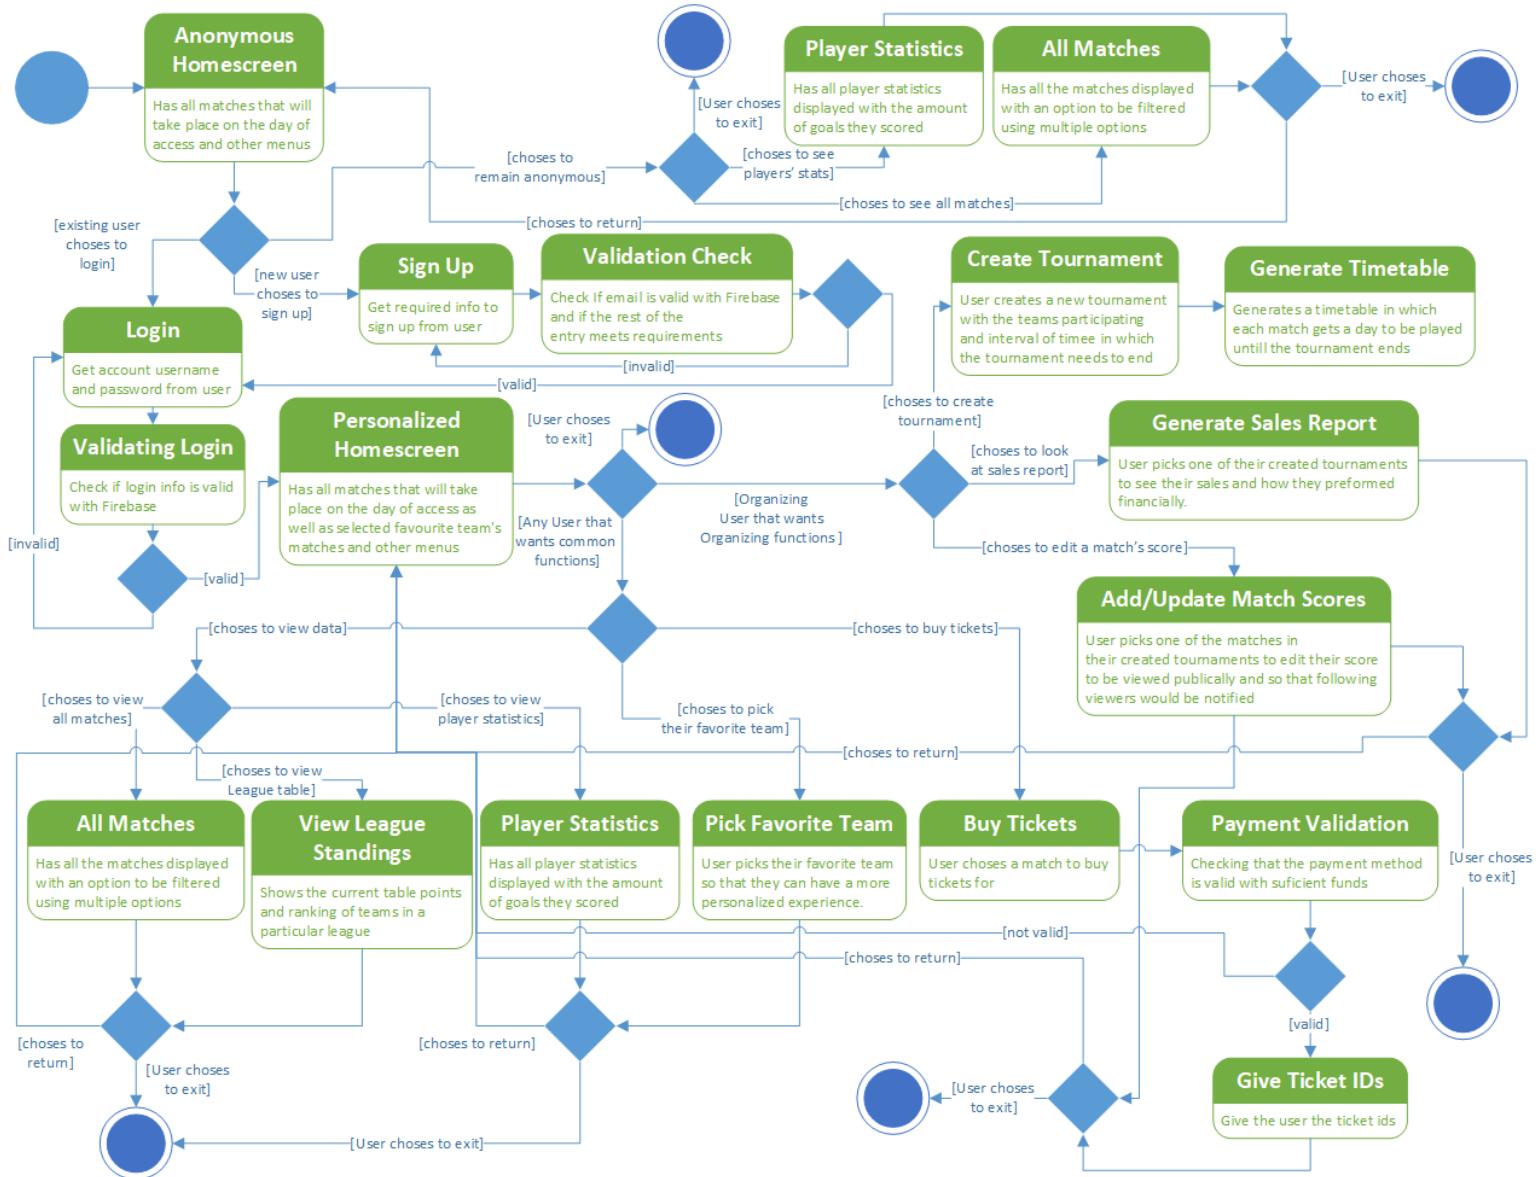

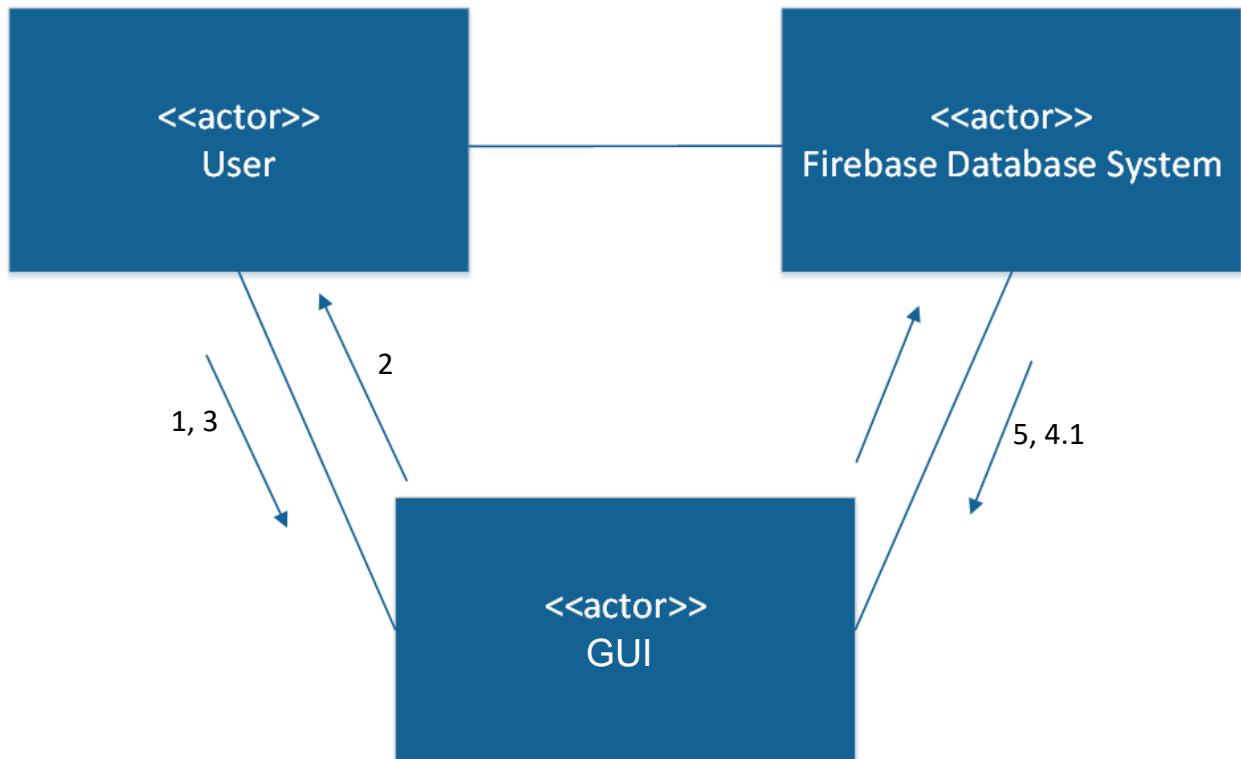

Figure 5: State Diagram

## **9. Interaction (Collaboration) Diagrams**

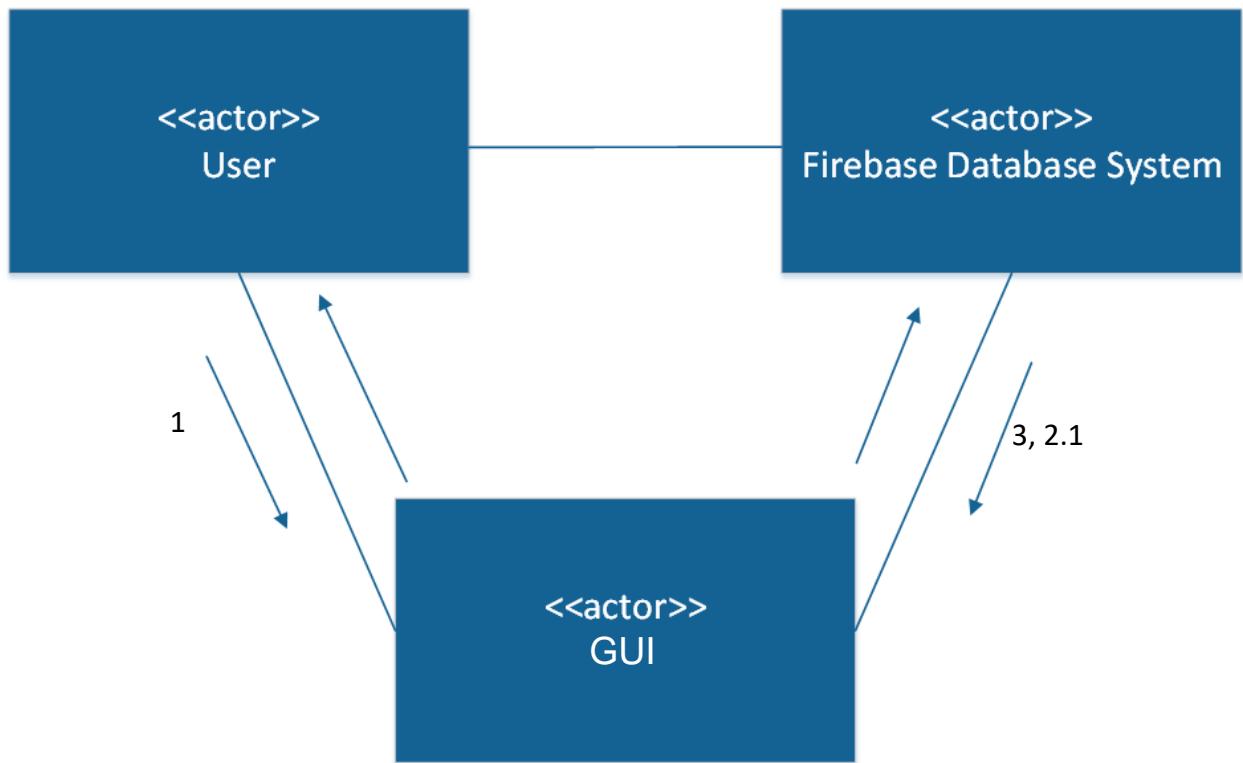

In this section, collaboration diagram was adopted as an interaction diagram showing the interaction between the different actors of the system. Below, a collaboration diagram is provided for each one of the aforementioned use cases.

### **1- WWeSign Up**

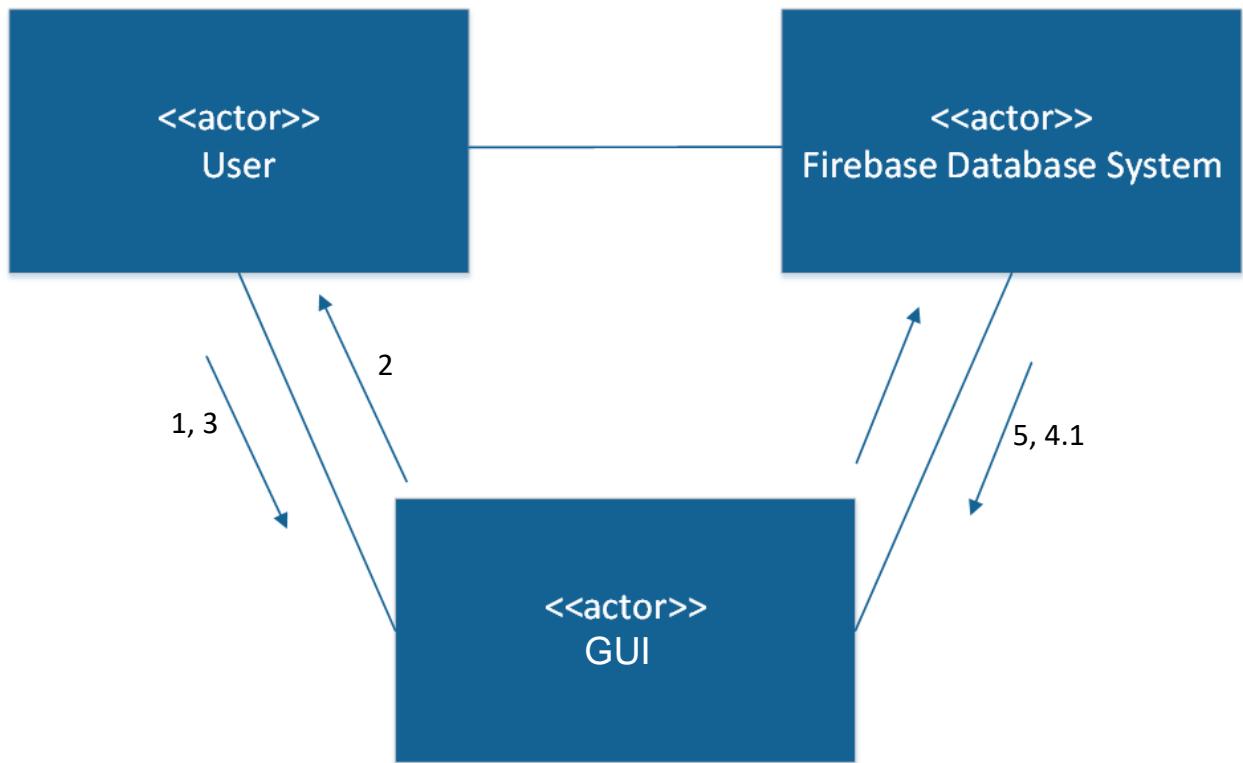

1. The user requests to register for a new account.
  2. GUI brings up sign up form
  3. The user fills in the required personal information.
  4. The user's details are sent to be verified using the credentials' authentication database system.
  5. A success message pops up.
- 4.1** The request is rejected, and an error message pops.

**2- Check that provided information meets requirements.**

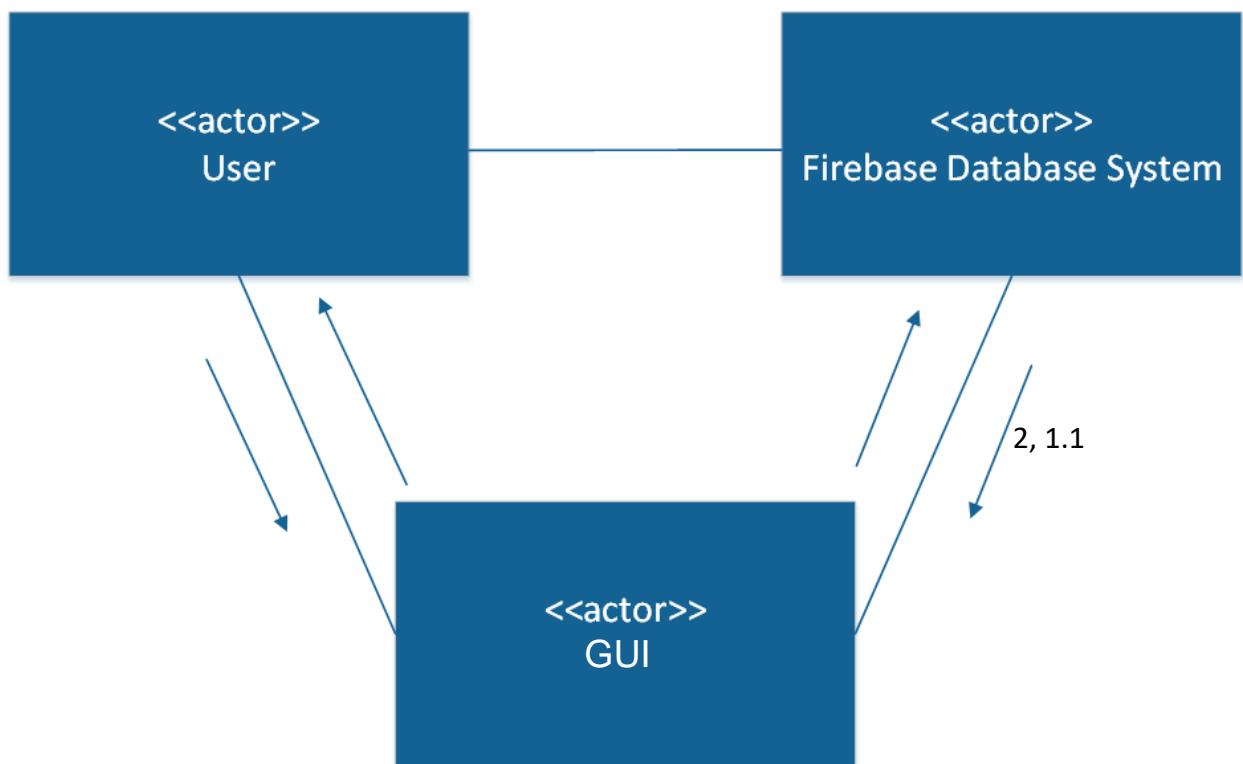

- 1.** The user fills in the required personal information.
  - 2.** The user's details are sent to be verified using the credentials' authentication database system.
  - 3.** Account is added, and success message pops up.
- 2.1** The request is rejected, and an error message pops.

### 3- Login

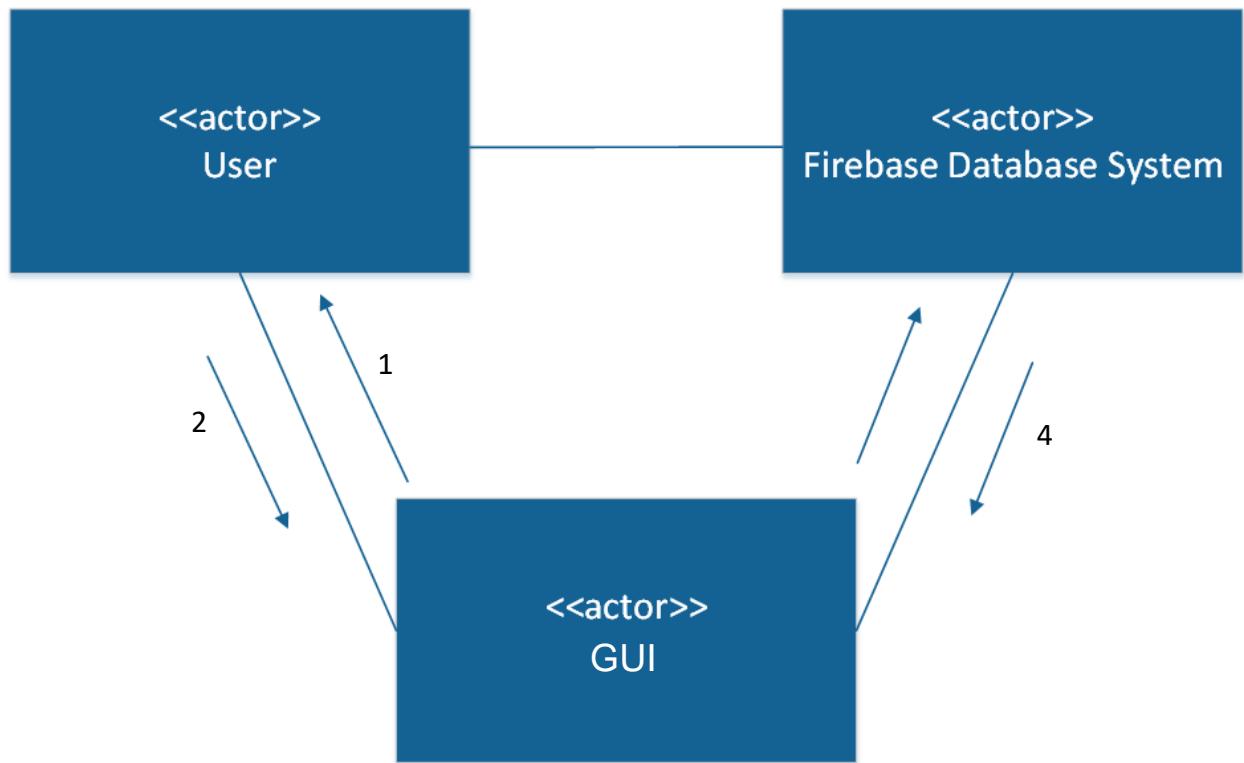

1. The user requests to login to his account.
  2. GUI brings up login form
  3. The user fills in his username and password.
  4. The provided credentials are verified using the credentials' authentication database system.
  5. The user logs in and return to his customized home page
- 4.1** Login fails, and a specified error message pops.

#### 4- Check login validity

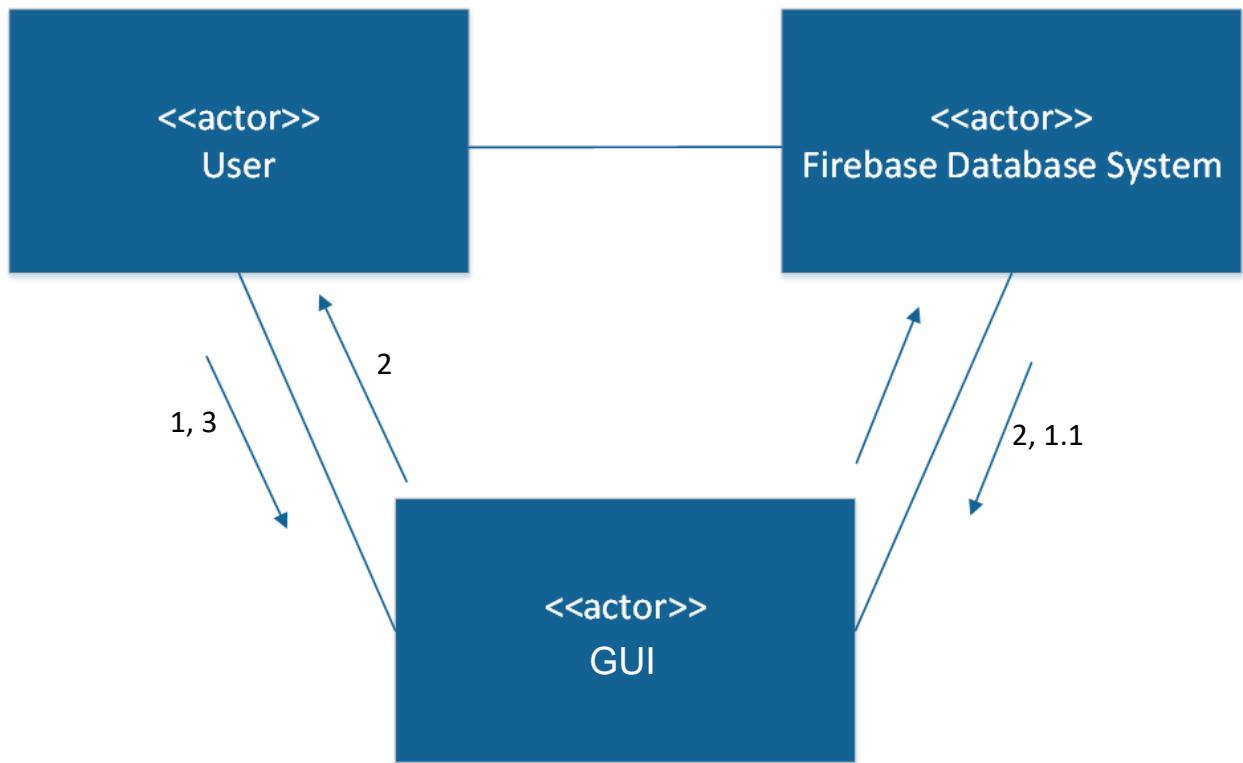

1. The database system is provided user credentials.
  2. Return success message
- 1.1      Return error message.

## 5- Select Favorite Team

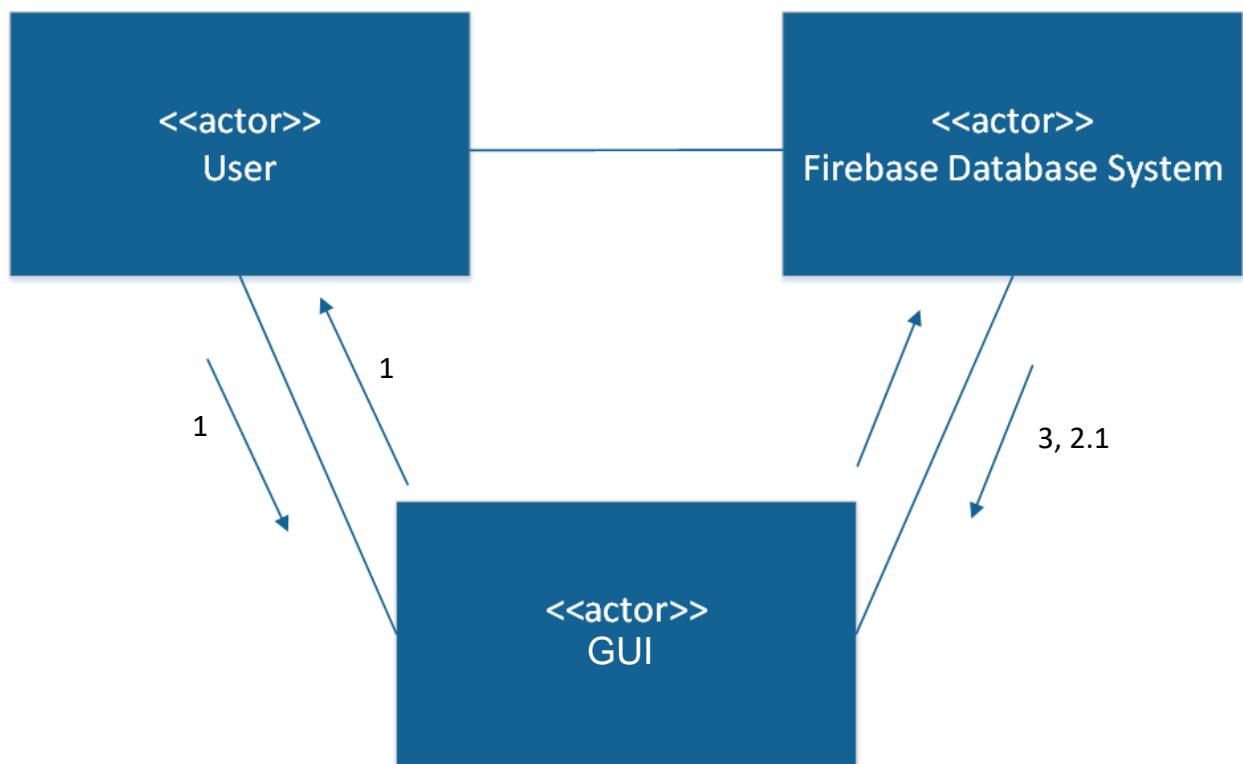

1. A team list is provided with all the included teams
2. User selects team name from list
3. The team is added to his list
4. Home page matches are updated with the team matches

#### 6- Add Team Matches to Home screen

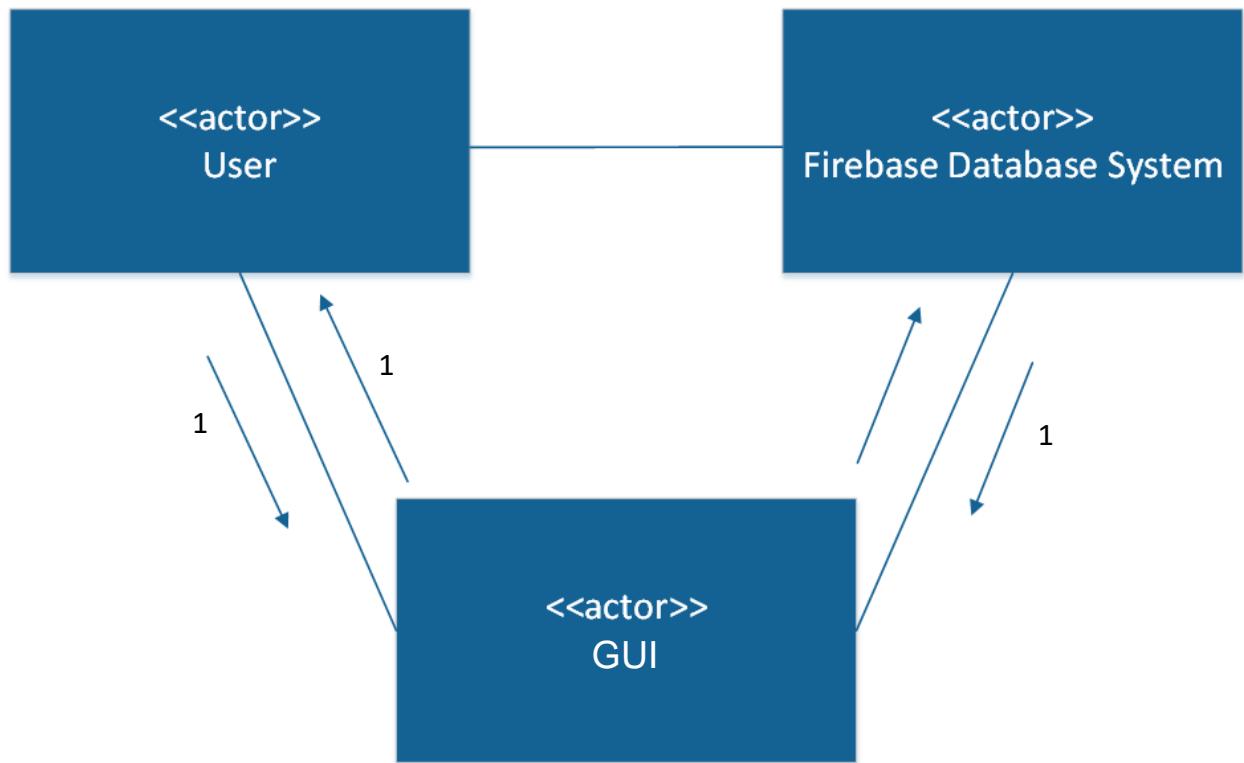

1. Teams' list is provided to fetch for their matches.
2. Matches' list is retrieved and sent to be viewed on screen.
- 1.1 No matches are found, and a message is viewed on screen

## 7- Filter view of Matches

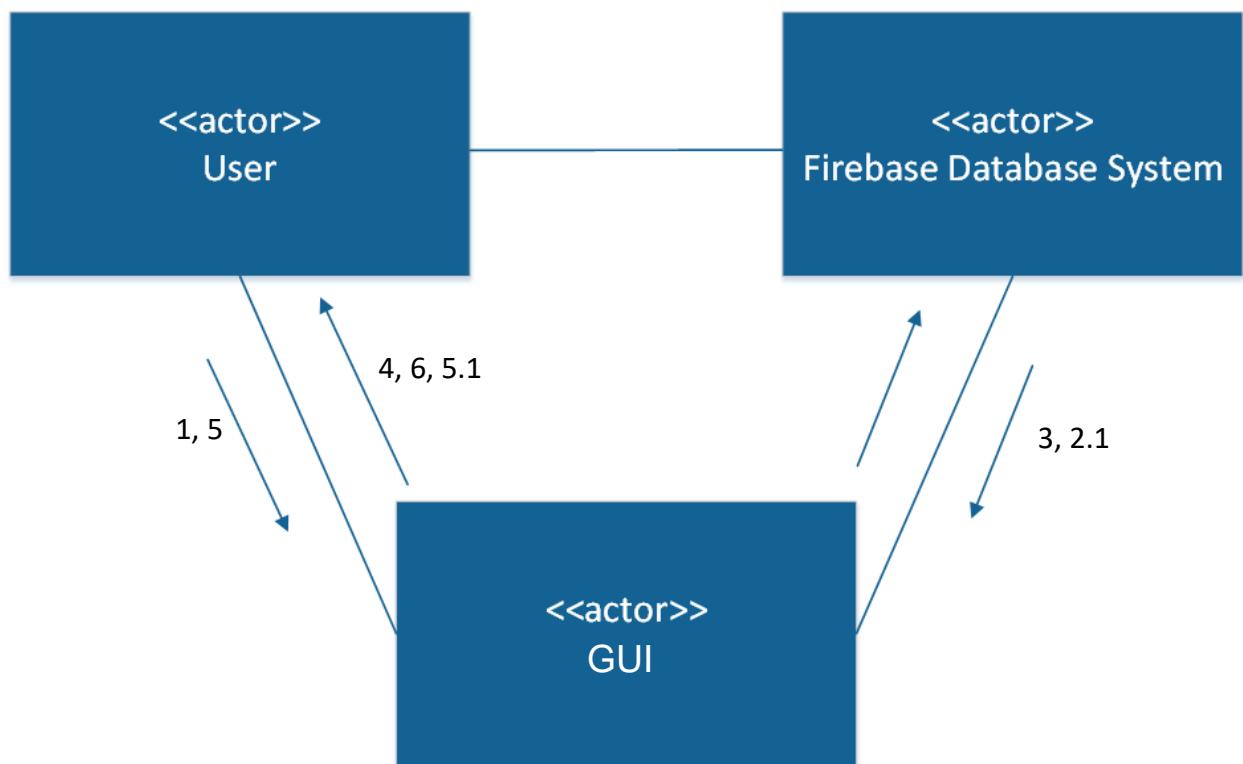

1. The user edits any of the date, team, or tournament filters.
2. Database system fetches the match conforming the received filters.
3. The matches' list is retrieved from the database to be viewed on the user's screen.
  - 2.1 No matches are found according to the set filters, and a message is viewed on screen

## 8- View Matches

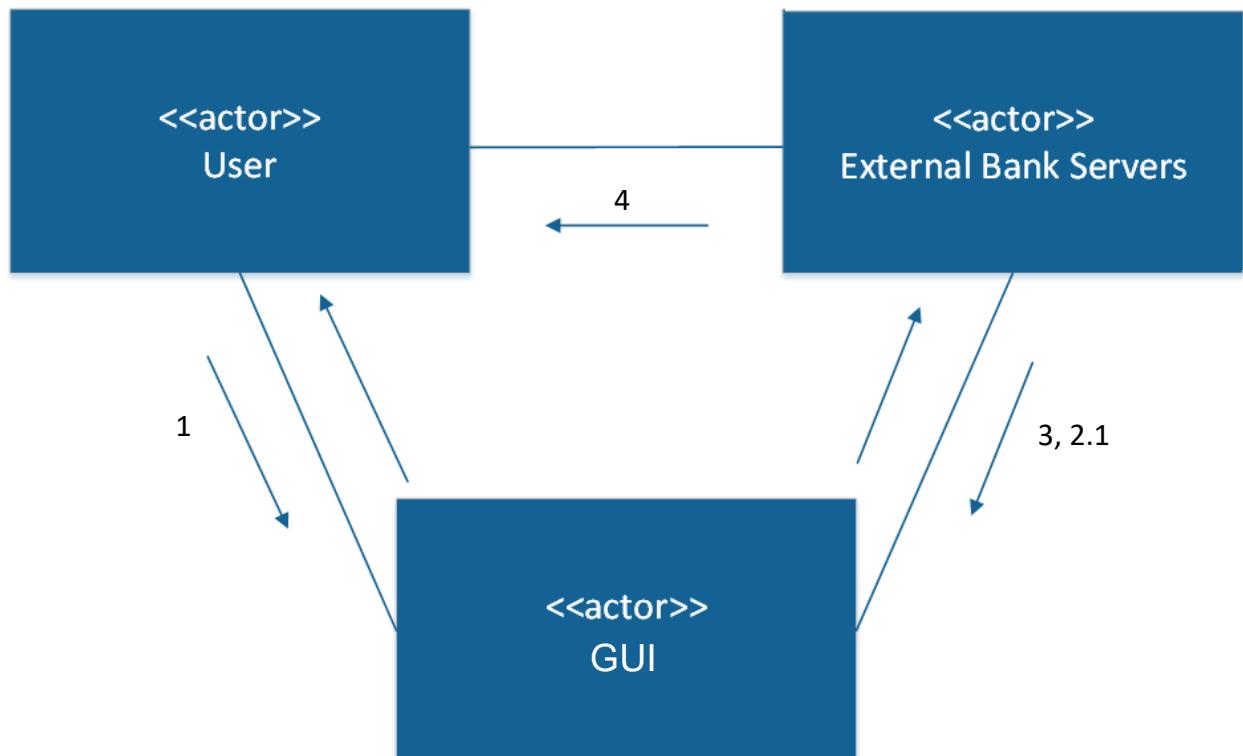

1. Matches' list received, formatted to cards that include team names, scores, fate and time, and list them on the user's screen.

## 9- Buy Tickets for a Match

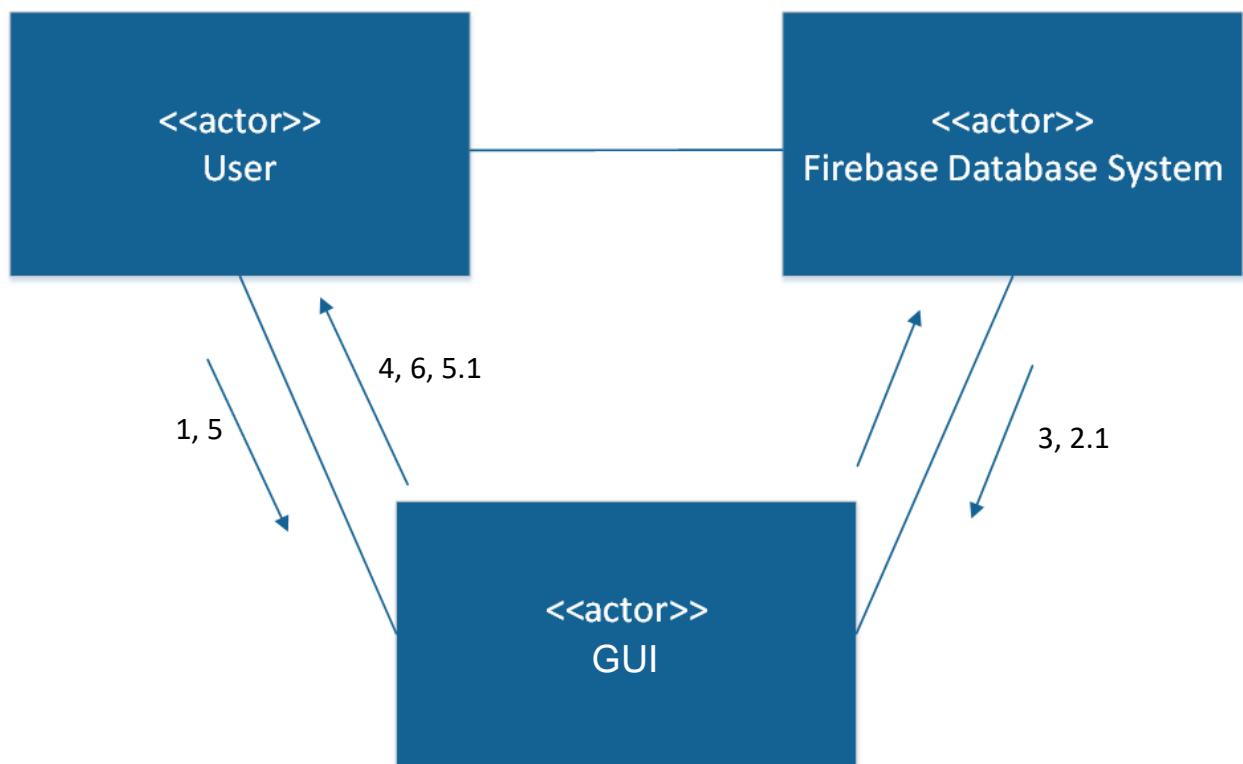

1. User selects match and number of tickets
2. Database check if number of tickets required is more than or equal available tickets for this match.
3. Total price is viewed on the screen.
4. User is asked to choose a payment method
5. User chooses cash or credit card payment.
6. Payment validated and success payment message received, and user gets a PDF file includes all tickets details.
- 2.1 Error message that the quantity chosen is not available.
- 5.1 Transaction rejected and failed payment message received.

#### 10- Create transaction & check for validity.

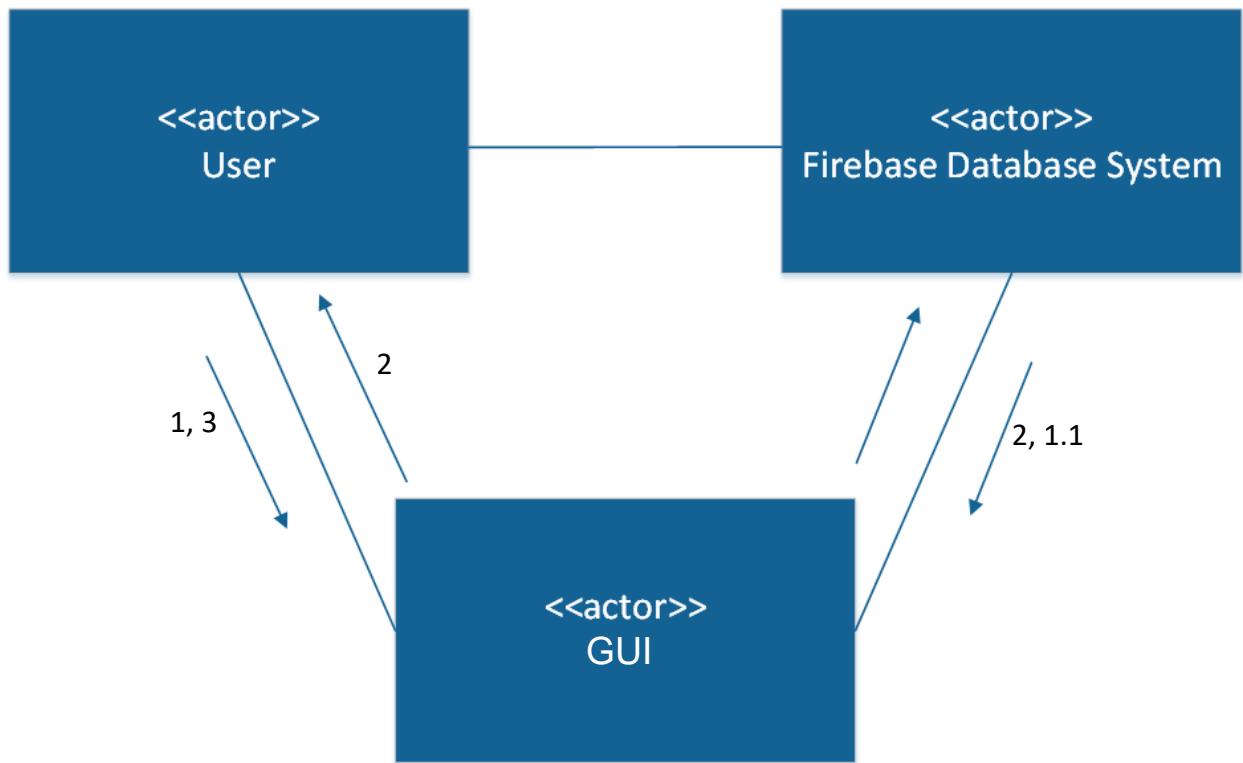

1. Credit/debit card information received.
  2. Information sent to bank servers to complete transaction.
  3. Success message received.
  4. Success message sent to the user.
- 2.1 Transaction refused message received.

### 11- View players statistics.

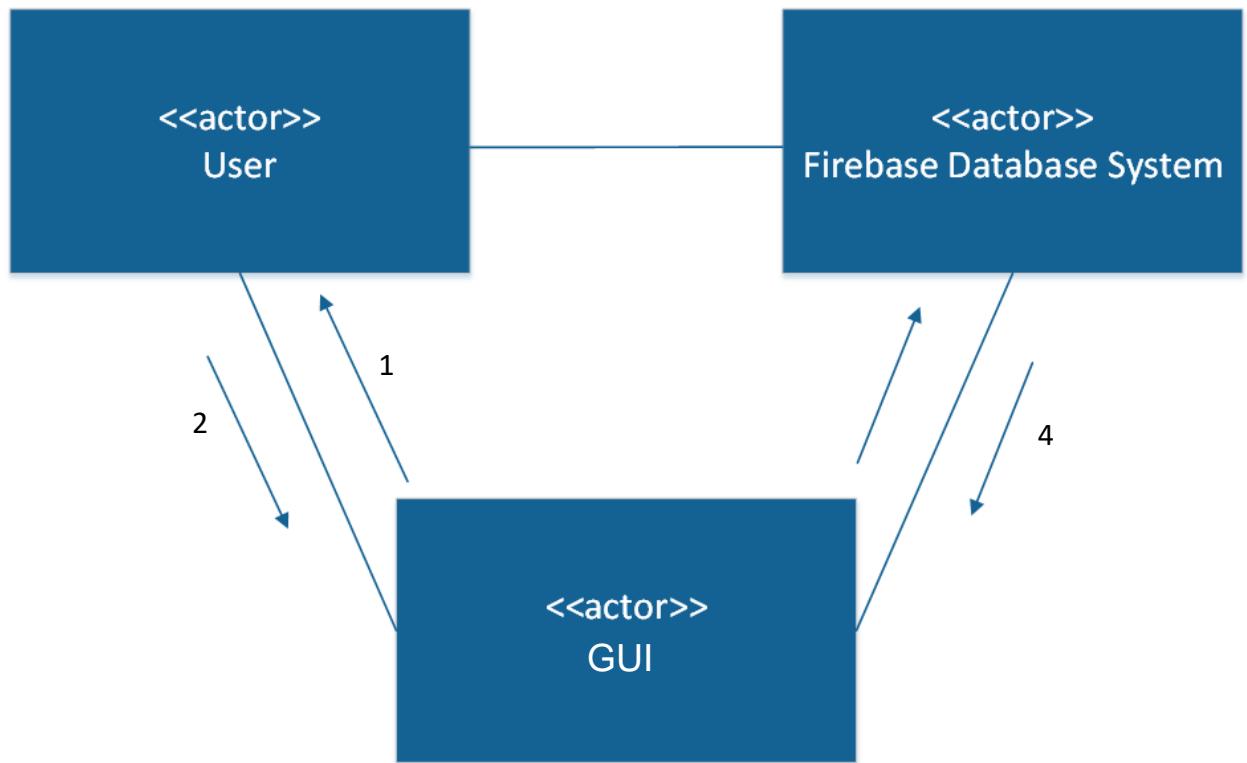

1. Fetch players' data from database.
2. Players' data are formatted to a player card format including his name, number of goals, team, and tournament names. Cards are then listed on user's screen.
3. Total price is viewed on the screen.
4. User is asked to choose a payment method
5. User chooses cash or credit card payment.
6. Payment validated and success payment message received, and user gets a PDF file includes all tickets details.
- 2.1 Error message that the quantity chosen is not available.
- 5.1 Transaction rejected and failed payment message received.

## 12- View league standings.

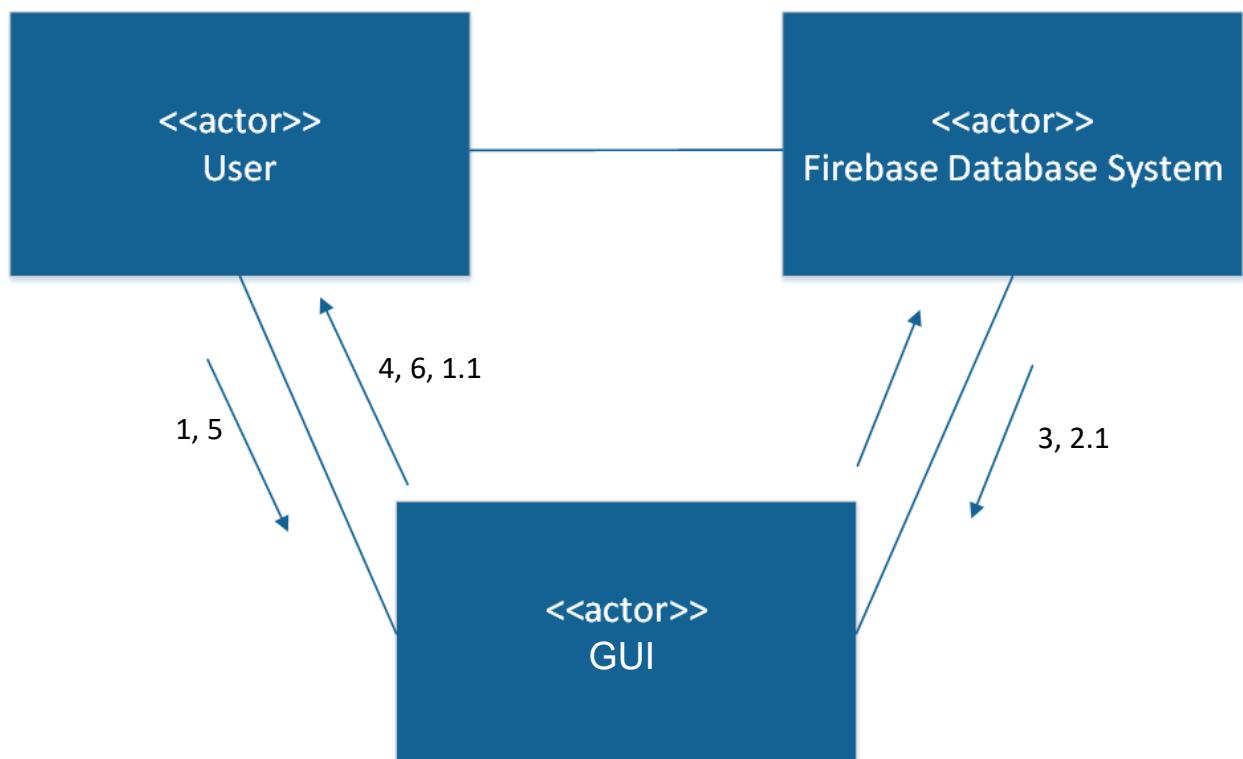

1. Fetch teams' list of the selected tournament from database.
2. Sort teams' list according to points account, if two of them have equal number of points, refer to the goals difference and display all teams' details in a table view.
- 1.1 No teams are found, and an error message is viewed on screen

**13- Generate sales report.**

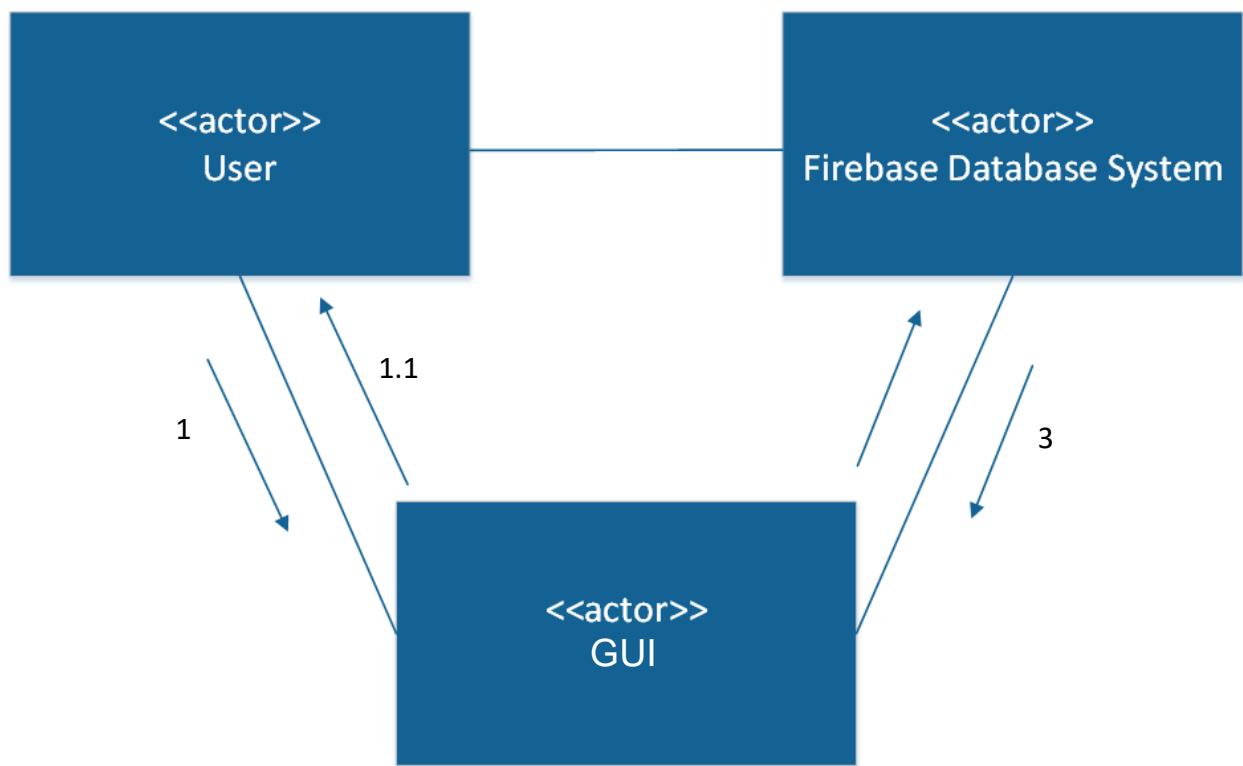

1. A tournament list is provided with all the available tournaments
2. Tournament Organizer selects tournament from list
3. Retrieve matches and tickets lists of the selected tournament from the database.
4. Create a sale formatted PDF file to view and open

#### 14- Add/update match score.

1. Tournament organizer selects a tournament.
2. Retrieve matches and players names lists of the selected tournament from the database.
3. Lists are returned.
4. User is asked to select a match from the list provided.
5. Organizer chooses the match he wants to update and adds the match final score.
6. Match final score updated message appears.
  - 1.1 Error message appears stating that selected tournament does not have any match left not played.
  - 2.1 Error message that the selected match has a final score assigned to it.

### 15- Add/update match score.

1. Tournament organizer enters tournament details including, tournament name, teams count, teams' names, time frame, and number of legs.
  2. A timetable is generated specifying matches weeks, opponents, date, and time. All details are then added to the database.
  3. Success label pops up indicating the creation of a new tournament.
- 1.1** Error message due to similarity between new tournament and other tournaments names or start date comes after the finish date.

## 10. Class Diagram

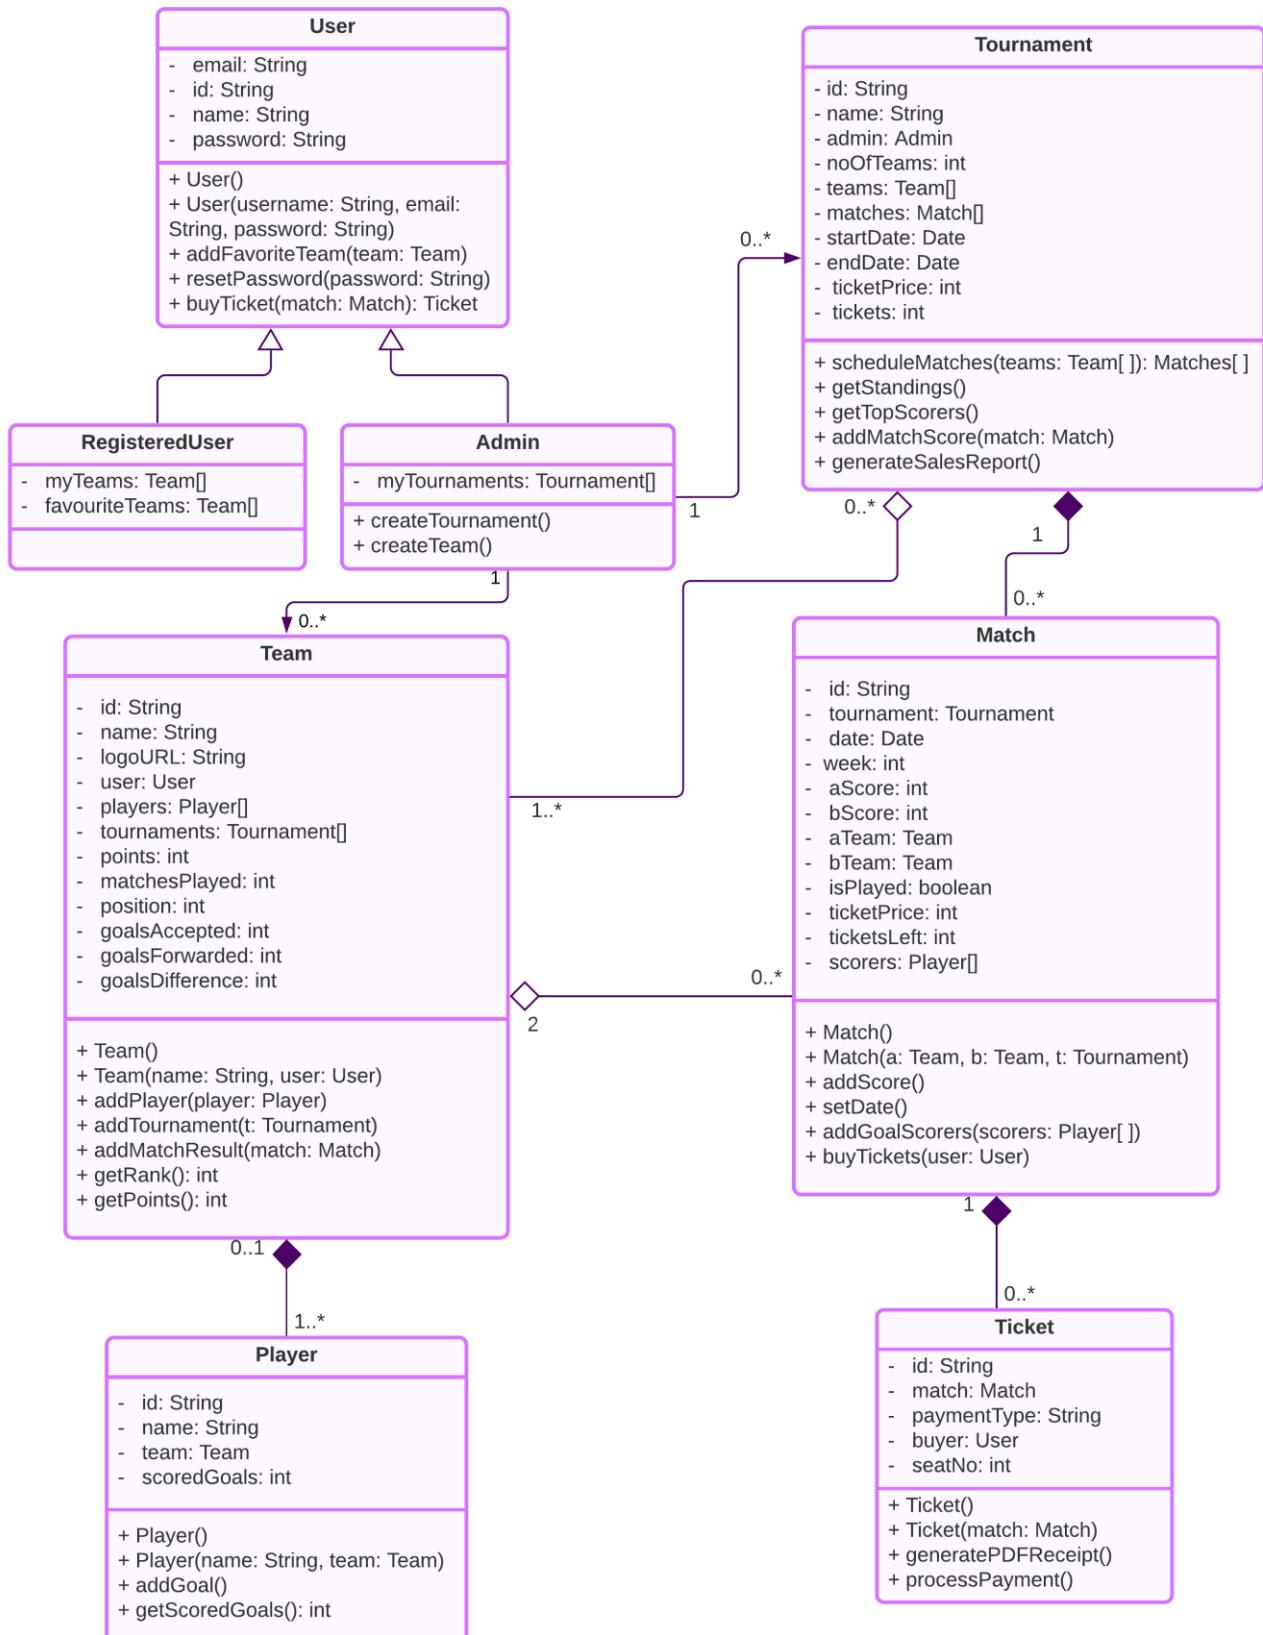

Figure 6: Class Diagram

- **Assumptions & Explanations:**

- All implemented setters and getters for class attributes are not explicitly shown in the class diagram.
- Class **User** is abstract as any user is assumed to be either an **Admin** or a regular **RegisteredUser**.
- Any tournament must contain at least 1 team, where a team can participate in more than one tournament.
- Any **Player** can be only registered in one **Team**, so there is no option for a registered player to be added to two different Teams.
- All matches within a specific tournament have the same ticket price, so this attribute is added to the aggregating class, **Tournament**.

## 11. Client-Object Relation Diagram

The below figure shows the client-object relation diagram for this system. An arrow heading from object A to object B means that object B is a client of object A and able to create an instance of it. **AppController** is the only class object that will be initiated by the main application object (**NazamlyApplication**), because if initiated, all other objects can be initiated accordingly.

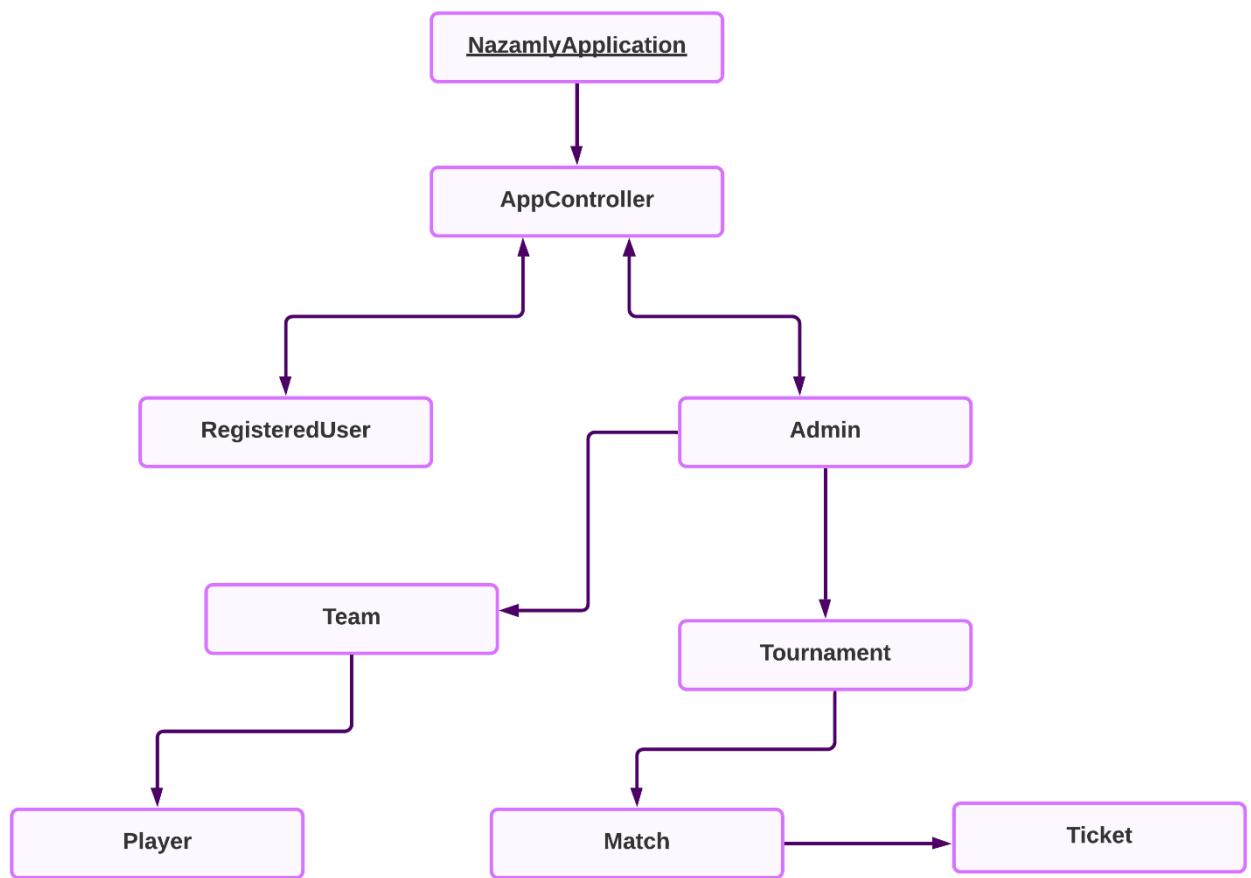

Figure 7: Client-Object Relation Diagram

## **12. OOAD Methodologies**

The main goal of the Object-Oriented Analysis and Design (OOAD) is to reach the detailed specifications of all classes including its attributes, methods in addition to the relationships between these classes. In the analysis phase, classes names, attributes, and relationships between them are identified. Later in the design phase, class methods are identified and verified.

Over the years multiple methodologies have appeared and developed by several people. For instance, Beck and Cunningham came up with Class-Responsibility-Collaboration (CRC) cards in 1986, which was applied on our system and discussed in [Section 6](#) of this document.

During the analysis and design of our Nazamly system we followed and applied 2 well-known methodologies, the Object modeling technique (OMT) and the Booch methodology.

### ***12.1. Object Modeling Technique (OMT)***

OMT describes a method for the analysis, design, and implementation of a system using an object-oriented technique.

In the analysis phase, we try to identify objects and relationships between them based on the goal and domain of the problem, without giving much attention to the attributes or the methods of these objects.

#### ***1. Analysis***

In this phase the preparation of precise and correct modelling of the real-world problems is prepared. Analysis phase starts with setting a goal i.e., finding the problem statement.

##### ***1.1. Problem statement of our system was as follows:***

“Admin users can create and manage tournaments, add teams, and edit match scores; while normal users can follow teams and tournaments, view match scores and player stats, and buy tickets. You must be a registered user to add your favorite teams, view tournament standings, or buy match tickets either by cash or credit card. When an organizer user adds a team to his tournament, the team admin must accept this invitation to be added to this tournament. All users including anonymous can view match scores, goal scorers, and player stats. Finally, all registered users can edit some of their account info.”

Problem statement is further divided into object, dynamic and functional model.

### 1.2. **Object model:**

Presented by the object model that contains the suggested classes names and the relationships between them. (Class diagram with no attributes or methods)

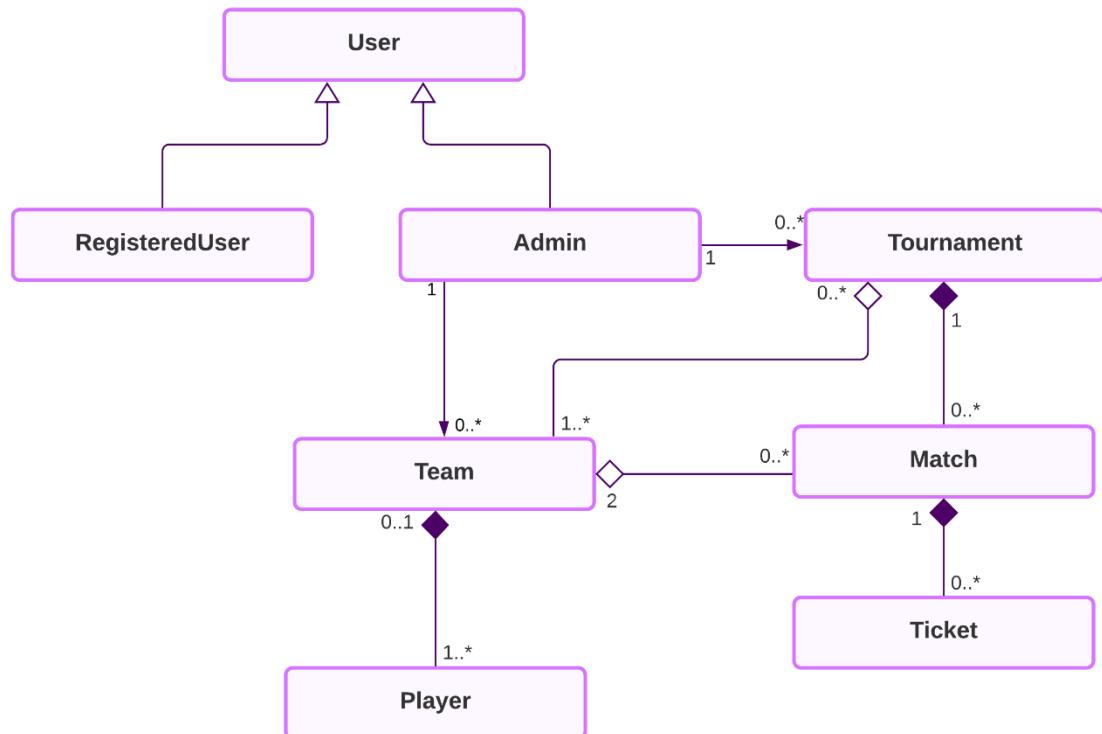

Figure 8: Object Model

### 1.3. **Dynamic model:**

Presented by the state diagram, describing the behavior of the system in a finite number of states that the system goes through as a whole. State diagram was earlier discussed and elaborated in [section 8](#), figure 5.

#### 1.4. Functional model:

This model describes the whole processes and actions using (DFD). It focuses on how data is flowing, where data is stored (data stores) and how it is processed. DFD starts with a context level before iterating to increase the details level from level 0 until reaching to a point where sufficient details are elaborated.

##### 1.4.1. Context diagram

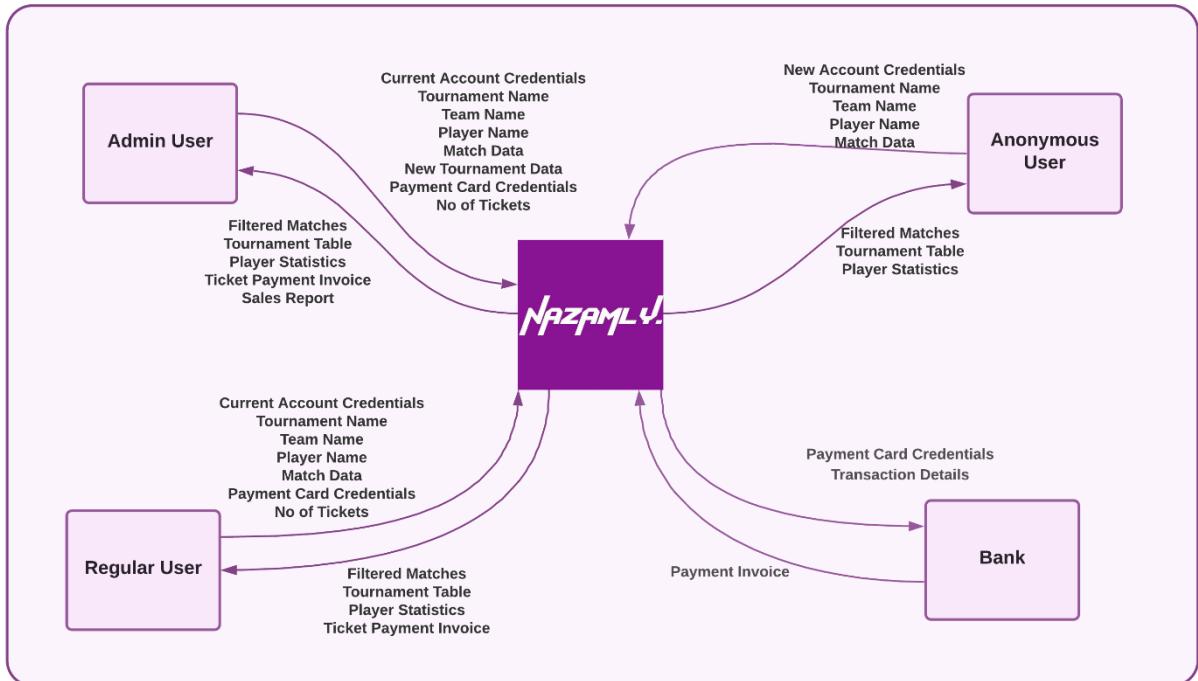

Figure 9: Context diagram

##### 1.4.2. Level 0 DFD

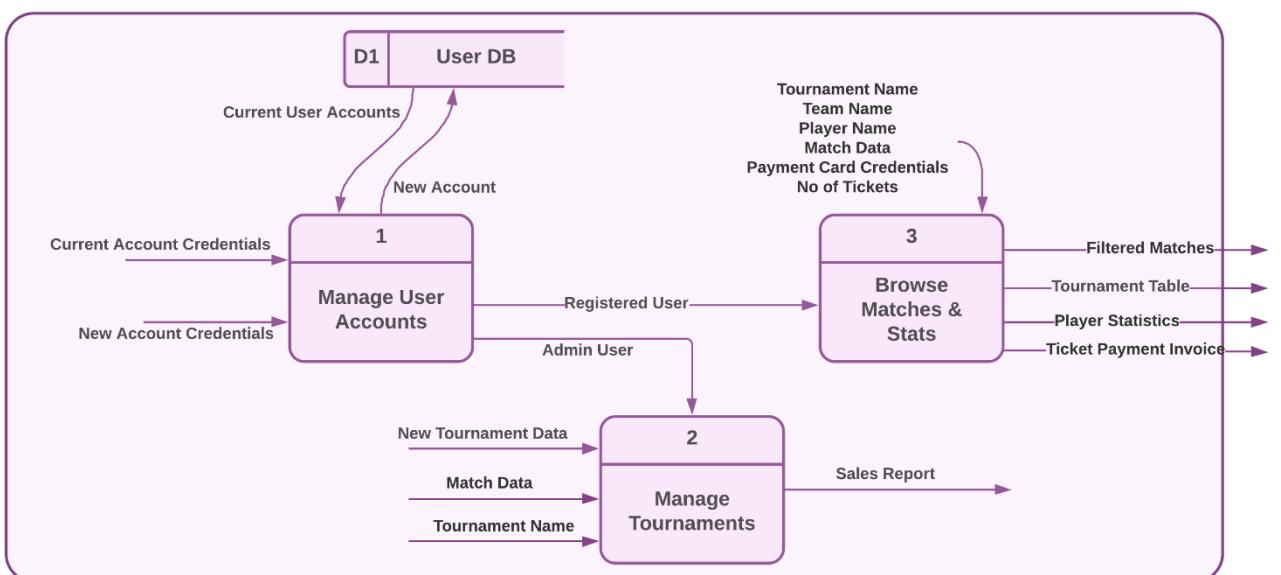

Figure 10: DFD Level 0

### 1.4.3. Level 1 DFD

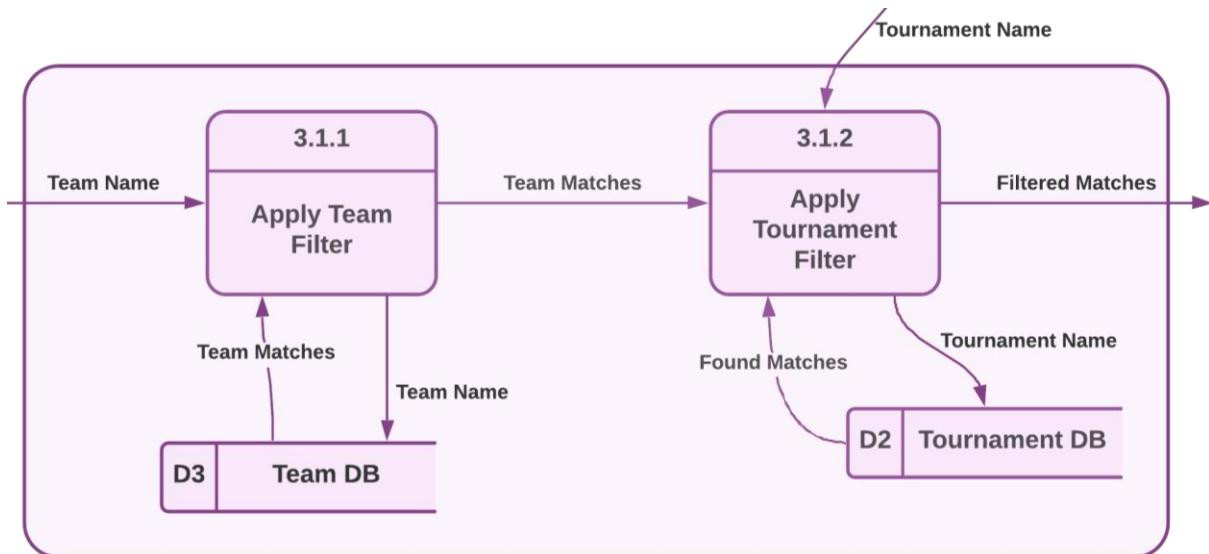

Figure 21: Process 3.1 Level 2 DFD

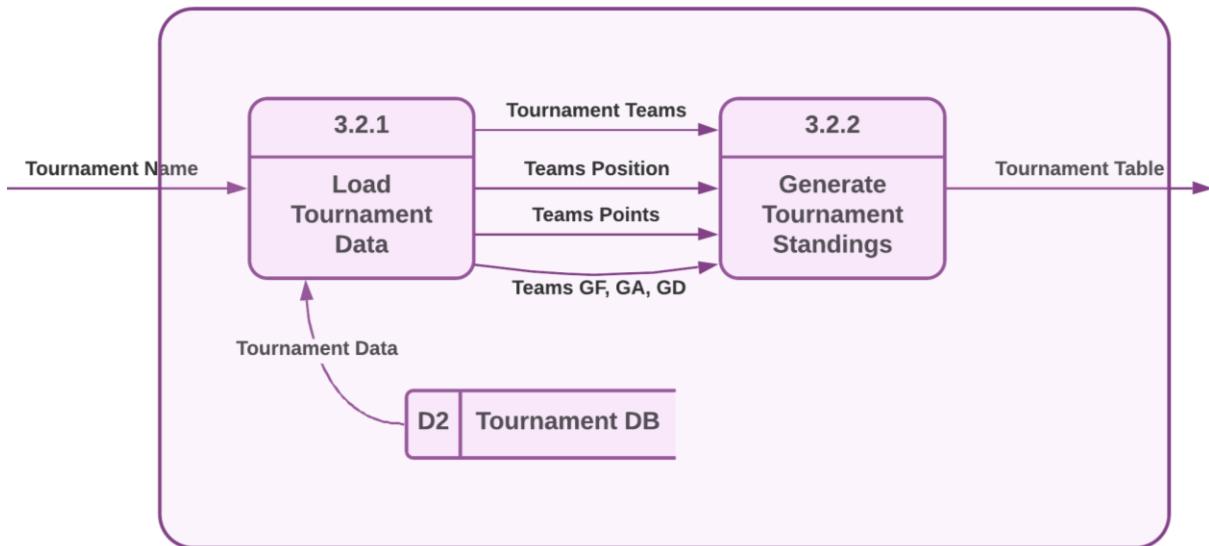

Figure 20: Process 3.2 Level 2 DFD

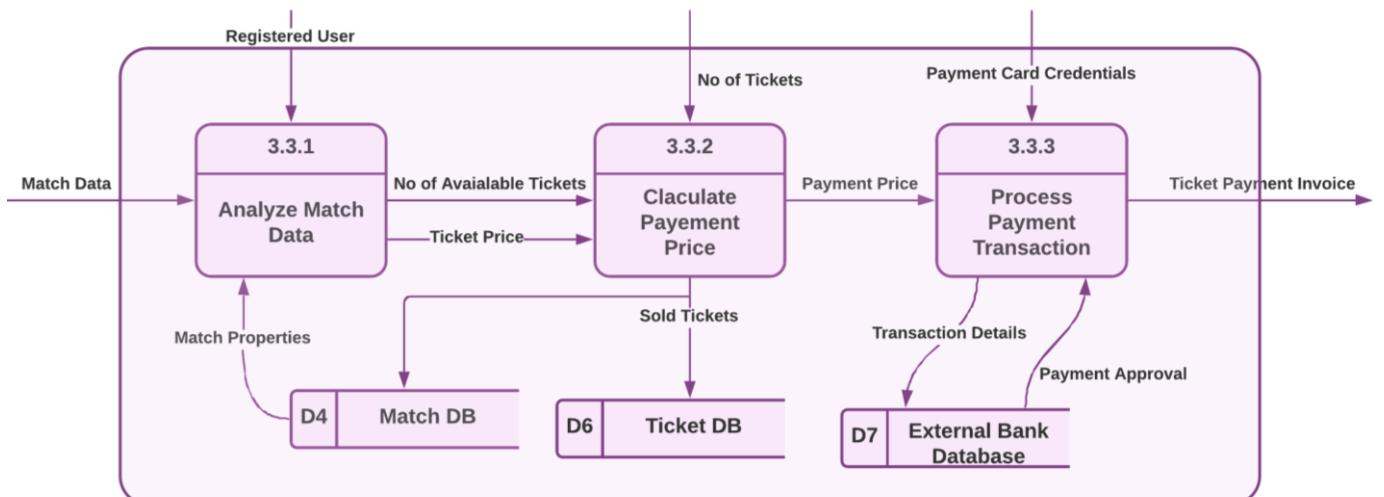

Figure 19: Process 3.3 Level 2 DFD

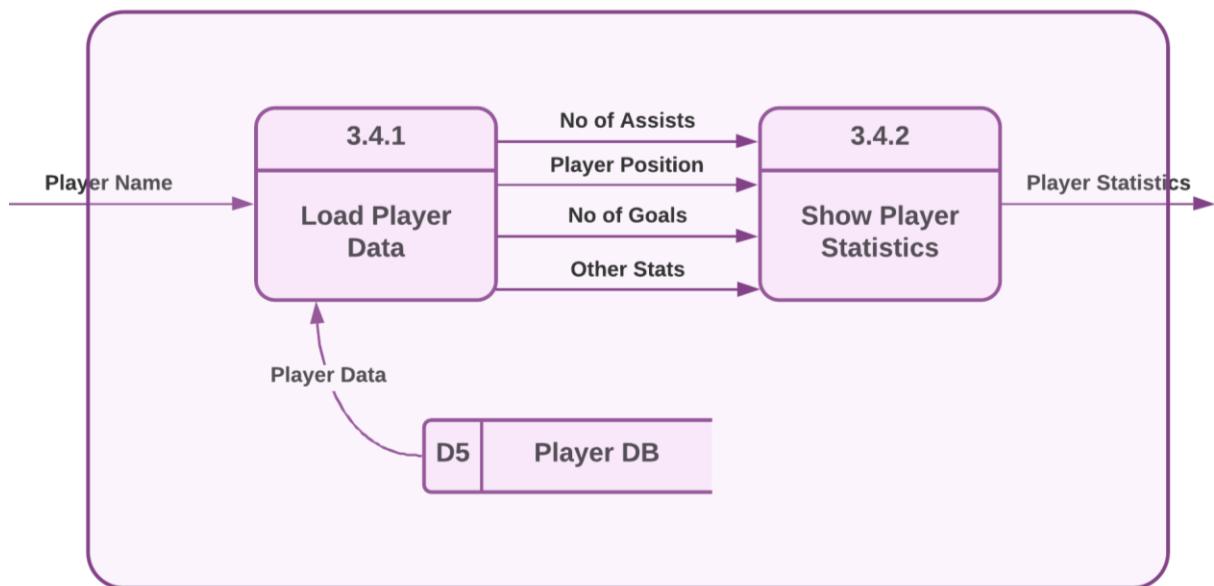

Figure 22: Process 3.4 Level 2 DFD

## 2. ***System design.***

System design determines all system architecture and data storage. High level architecture of the system is designed during this phase that decomposes the system into a set of subsystems and/or packages. This process is thoroughly described, discussed, and diagrammed in [section 14](#), later in this document.

## 3. ***Object design.***

This phase produces a design document, consisting of detailed objects and dynamic and functional models. It is concerned with classification of objects into different classes and about attributes and necessary operations needed. Class diagram was provided earlier in [section 10](#) of this document.

## 4. ***Implementation.***

During this phase, the design is translated into the software. Project full source code is attached with the document.

## 12.2. Booch methodology

This method only covers the analysis and design phases of object-oriented software systems development, and it can be divided into 2 main processes:

- 1- **A macro development process** treating the OOAD in a more abstract look, focusing on the big picture, and consisting of the following steps:

- 1.1. Conceptualization
- 1.2. Analysis and development of the model
- 1.3. Design the system architecture.
- 1.4. Evolution
- 1.5. Maintenance

- 2- **A micro development process** that dives deeper into the classes' details generating a refined version of the class diagram after each of the following steps:

- 2.1. Identify classes and objects
- 2.2. Identify class and object semantics
- 2.3. Identify class and object relationships
- 2.4. Identify class and object interfaces and implementation

The Booch methodology consists of the following diagrams:

- **Class diagram:** Discussed and diagrammed in [section 10](#).
- **Object diagram:** Mainly focuses on the lifecycle of the object. Same as class diagram but class names are underlined.
- **State transition diagrams:** Same as state diagrams which are used to identify the methods needed, [section 8](#).
- **Module diagrams:** Same as component diagram, [section 15](#), grouping each set of classes that interact together to reach a certain goal and are named modules, components or packages.
- **Interaction diagrams:** Sequence or collaboration diagrams, discussed in [section 9](#). After identifying methods in the state diagram. They help in setting a specific procedure of assigning each method to a specific class, where the method shall be a part of the class at the arrowhead in the interaction diagram.

## **13. Comparative Analysis**

### ***13.1. Object Modeling Technique (OMT)***

OMT was one of the earliest methods adopted for object-oriented analysis and design of software systems, but it had many cons beside its pros. From its main disadvantages is:

- Objects identified in the analysis phase can't be verified as the objects' definition is highly subjective to the analyst problem understanding, opinions, and experience.
- Lack of step-by-step procedure to identify objects increases the error possibility.
- Many iterations required to reach an optimum analysis and design to the system.
- Considering a forth step for implementation was not necessary as OOAD only focuses on the analysis and design before the software implementation in terms of code.
- Data flow diagrams (DFD) used are not a UML standardized diagram, which make it inconvenient to use.

### ***13.2. The Booch methodology***

The Booch methodology avoided many of the criticized specifications of OMT where:

- It removed the implementation phase as it mainly focuses on the analysis and design phases only.
- This methodology also helps in filling the gaps found in the OMT, where Booch differentiated between classes and objects.
- Unlike OMT which leaves the methods classification to the analyst judge, interaction diagrams adopted by Booch help in setting a specific procedure of assigning each method to a specific class, where the method shall be a part of the class at the arrow head in the interaction diagram.

## **14. ARCHITECTURAL MODEL**

Building a software system needs a study of several architecture styles to wisely choose the most suitable style that correctly defines the system's structure, which is most commonly a merged style of more than one style.

Therefore, designing Nazamly was no different as it is built of a merged style that is a combination of 3 different well-known styles, MVC, data-centered, and object-oriented architecture styles, which will be discussed in the following sections.

### ***14.1. Object-Oriented Architecture***

In this style, the system components encapsulate data and only allow manipulating them through methods in units called objects, as shown in the UML class diagram (provided earlier in section 10) (Figure 3), where communication between them is accomplished via message passing.

### ***14.2. Blackboard (Data-centered) Architecture***

Using this architecture style allows the system to have a datastore, a Firebase database in our situation, that resides at the center of this architecture, and it is accessed frequently by the system users to add, modify, update, and delete data through database services.

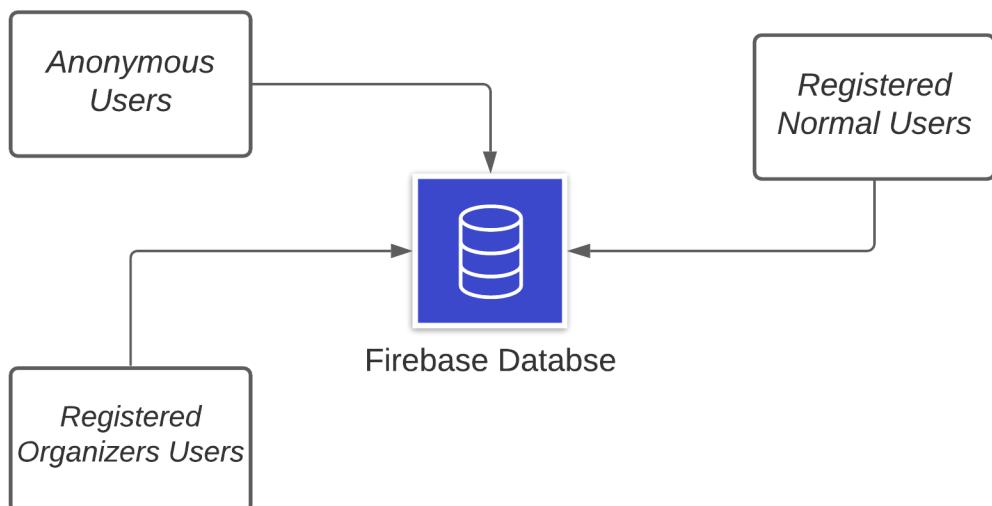

Figure 23: Blackboard Architecture

### **14.3. Model-View-Controller Architecture**

Known as MVC, model-view-controller architecture is a widely used one in web applications, consists of 3 main parts:

- *Model*: includes the data and its processing.
- *View*: includes representing data to the end-user as the graphical user interface of the webapp, provided sample screenshots on section 19 (User Guide), later in this document.
- *Controller*: includes input handling, business logic in addition to coordinating between the model and view components.

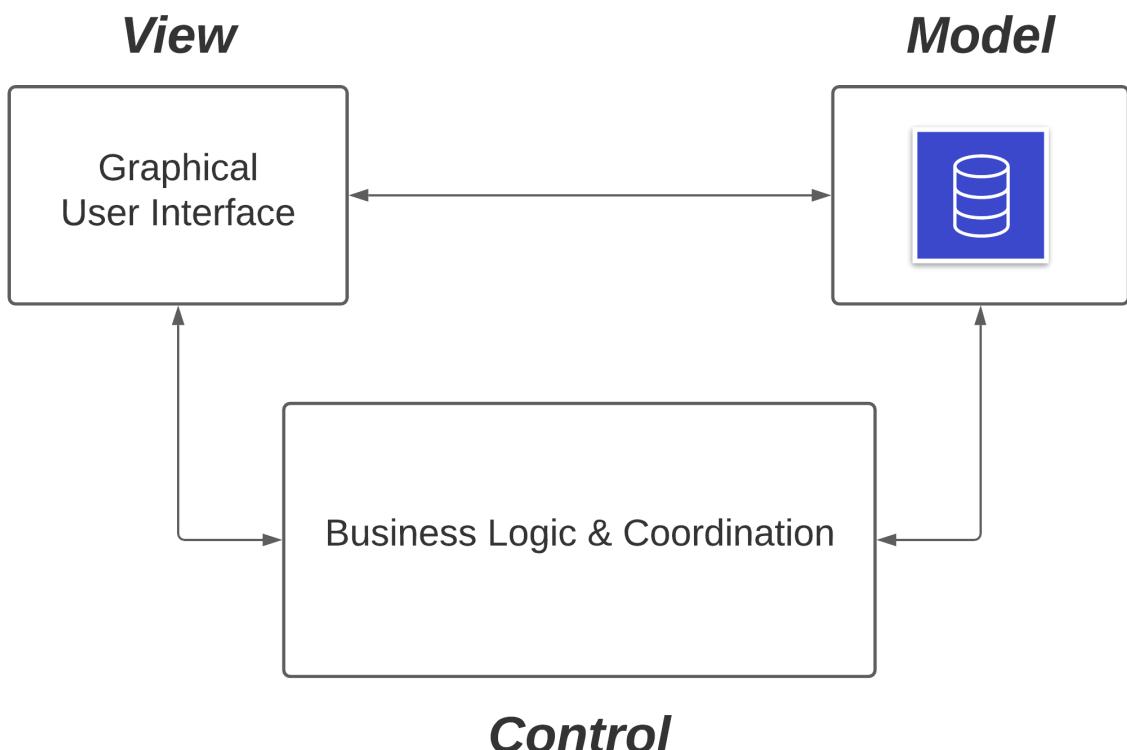

Figure 24: MVC Architecture

## 14.4. Merged Architecture Style

As mentioned before, building Nazamly requires a merged architecture style consisting of three of the discussed architectures. The MVC architecture is the framework of the design with the Control part utilizing the object-oriented architecture style, and the Model part making use of the data-centered style. The merged style designed by the Nazamly team is shown in the figure below.

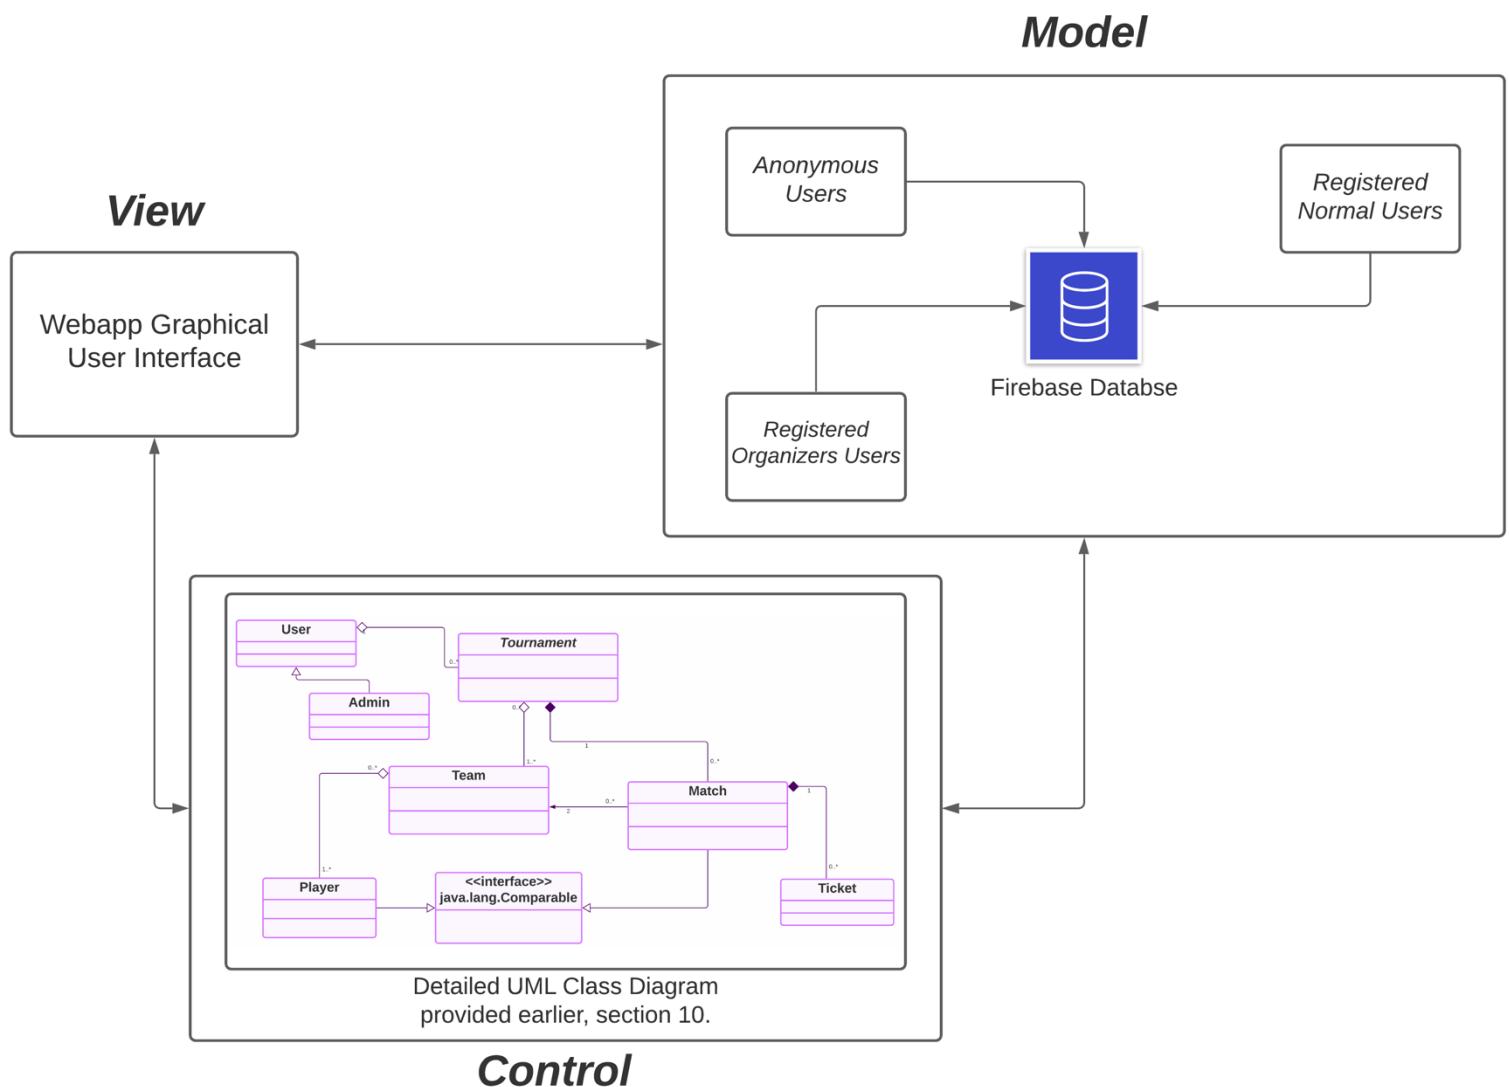

Figure 25: Merged Architecture Style

## 15. Component Diagram

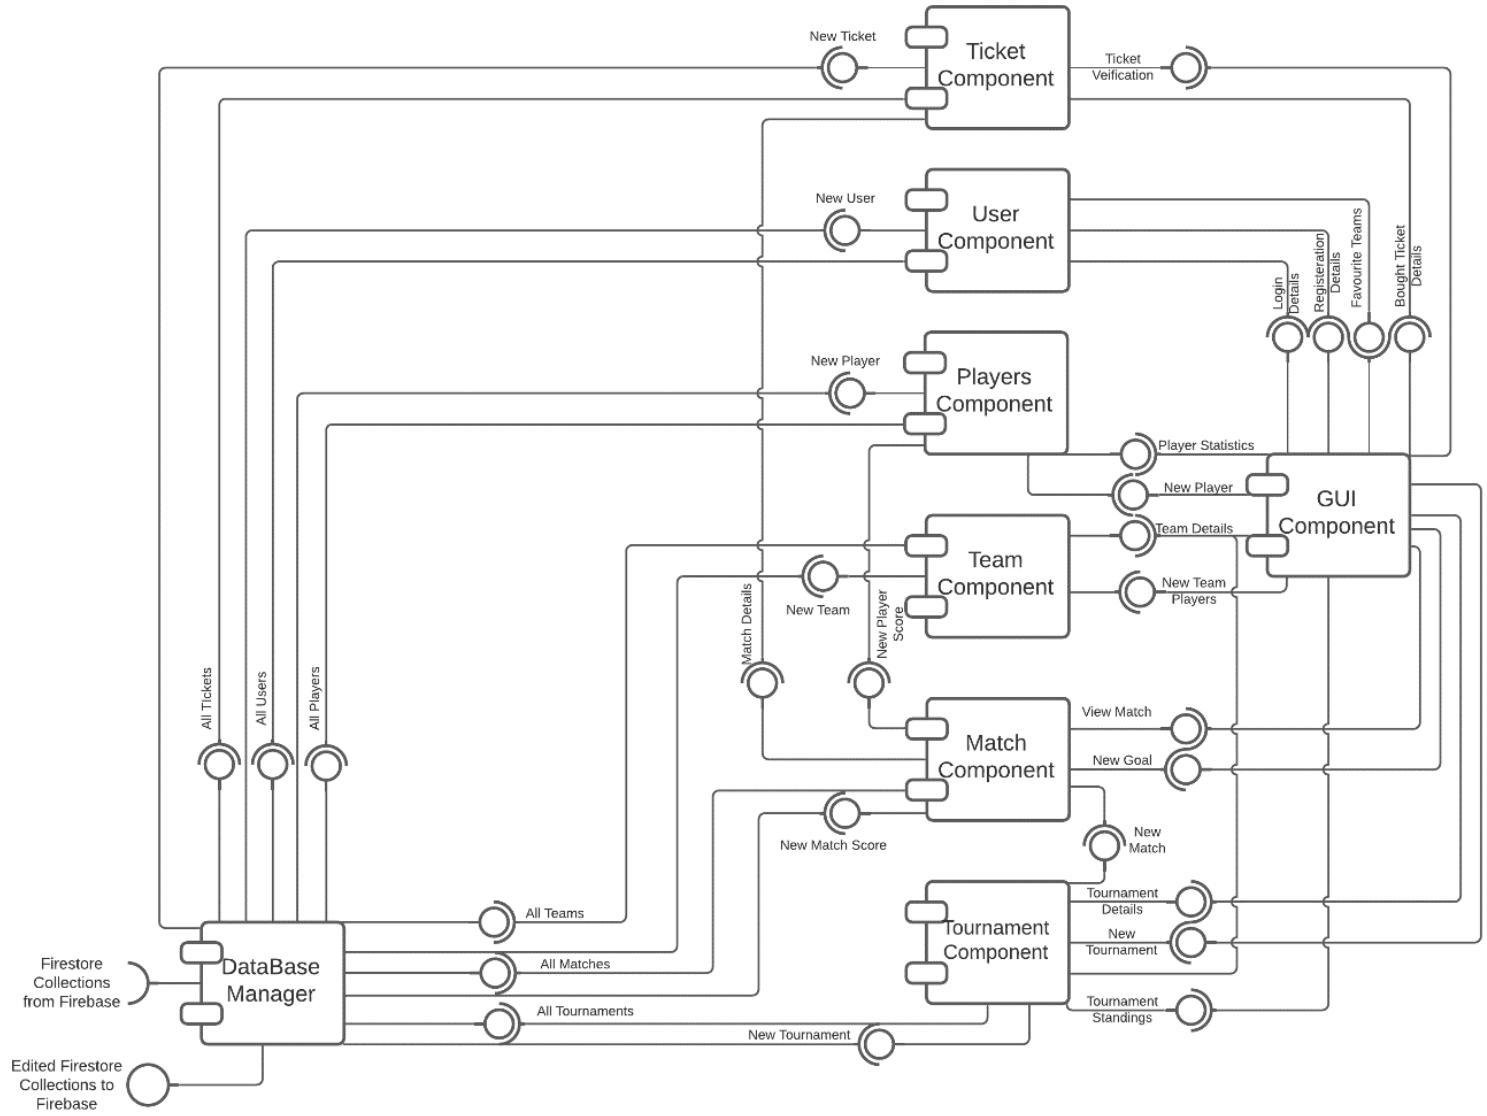

Figure 26: Component Diagram

## ***Narrative Description:***

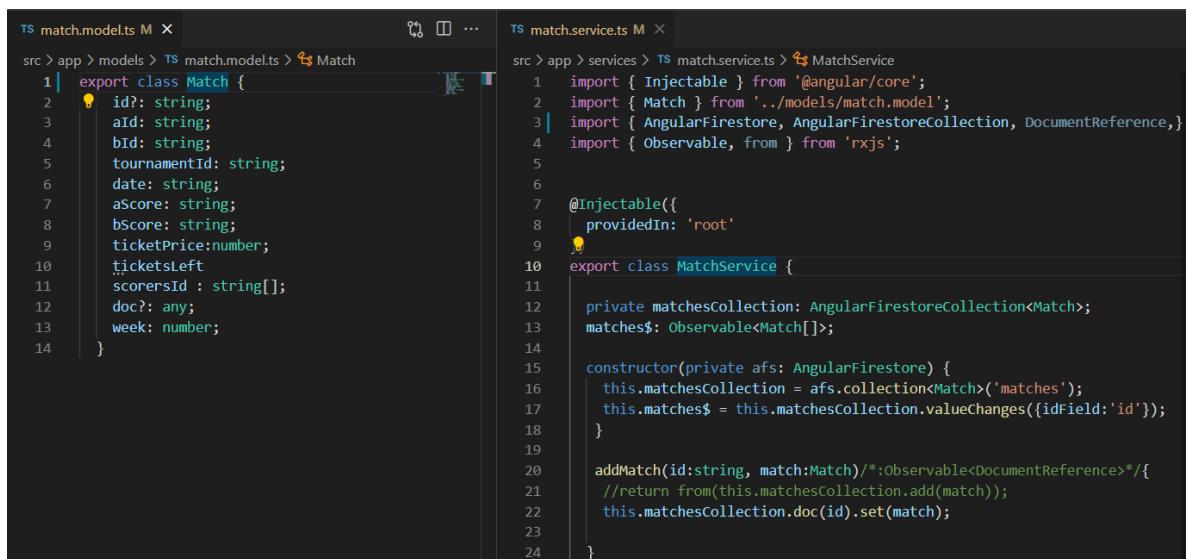

- The **DataBase Manager** component is responsible for retrieving all our data from Firestore as Observales Collections, and then converting them to JavaScript Arrays to be provided in different interfaces to the remaining components.
- The **Tournament** component receives all stored tournaments and process it to display required tournament details to the **GUI** component. It also receives new tournament data from **GUI** component and then creates tournament matches that are sent to the **Matches** component.
- The **Matches** component also receives all stored matches and filters them in order to be viewed accordingly with the applied filters. It also receives match score and new goals from **GUI** component and sends these data to **Player** and **Team** component.
- The **User** component receives sign up data from **GUI** and provides an interface with this new account data to the **Database Manager** to be stored in our Firestore. Also, it receives user login data from **GUI** and searches all registered user data that are received from **Database Manager**.
- The **Ticket** component receives any requested ticket from **GUI**, and provides an interface with the new ticket data to the **Database Manager**. It also retrieves all tickets data from **Database Manager**, and allows a tournament admin to verify if a certain ticket id is valid or not.

## 16. Testing

### 16.1. **Unit Testing**

As mentioned earlier, Nazamly web application is developed using Angular framework. And it is important to be noted that, in Angular, the application structure is mainly divided into modules that are composed of smaller related components. An angular component actually represents a single web page in the application and hence comprises a TypeScript (.ts) file, HTML (.html) file, and CSS (.scss) file for this single component.

In addition, the system classes, represented earlier in the class diagram, are generally implemented into two files: a model and a service. The class model (*.model.ts*) actually comprises the class data members, while the service (*.service.ts*) provides all the required functionalities related to this class. For example, the **Match** class, shown before in the class diagram, will be implemented in two files: *match.model.ts* and *match.service.ts*, as shown in the below figure.

The screenshot shows two code editor panes. The left pane contains the `match.model.ts` file:

```
src > app > models > TS match.model.ts > Match
1 | export class Match {
2 |   id?: string;
3 |   aid: string;
4 |   bid: string;
5 |   tournamentId: string;
6 |   date: string;
7 |   aScore: string;
8 |   bScore: string;
9 |   ticketPrice:number;
10 |   ticketsLeft
11 |   scorersId : string[];
12 |   doc?: any;
13 |   week: number;
14 }
```

The right pane contains the `match.service.ts` file:

```
src > app > services > TS match.service.ts > MatchService
1 | import { Injectable } from '@angular/core';
2 | import { Match } from './models/match.model';
3 | import { AngularFirestore, AngularFirestoreCollection, DocumentReference, } from 'angularfire2/firestore';
4 | import { Observable, from } from 'rxjs';
5 |
6 |
7 | @Injectable({
8 |   providedIn: 'root'
9 | })
10 | export class MatchService {
11 |
12 |   private matchesCollection: AngularFirestoreCollection<Match>;
13 |   matches$: Observable<Match[]>;
14 |
15 |   constructor(private afs: AngularFirestore) {
16 |     this.matchesCollection = afs.collection<Match>('matches');
17 |     this.matches$ = this.matchesCollection.valueChanges({idField:'id'});
18 |   }
19 |
20 |   addMatch(id:string, match:Match)/*:Observable<DocumentReference>*/{
21 |     //return from(this.matchesCollection.add(match));
22 |     this.matchesCollection.doc(id).set(match);
23 |   }
24 | }
```

Figure 27: Model and Service for Match class

Unit testing was applied after the implementation of each component, where the code is compiled first assuring there are no syntax errors or runtime exceptions, and then the whole application is served internally on a local host (<http://localhost:4200>) in order to test the web page that this recently-created component represents.

If there are any errors, exceptions, or visual mis-implementation in the page formatting; the code is modified, compiled, and served again until the desired implementation is achieved.

## **16.2. *Integration Testing***

This phase of testing begins after applying unit testing on each of the system components, where each component is added and integrated with the already developed part of the system and then tested as a whole. Integration testing is conducted to evaluate the compliance of this component with specified functional requirements, so all the functionalities that are shared between it and any other components or modules are tested, and all the external provided services that it may depend on are also tested if they are integrating well together.

For instance, after implementing and unit-testing the ***create-tournament*** component (that models the page for creating a tournament), integration testing was applied to test the proper integration of this component with the system. This was done by manually creating a tournament from the ***create-tournament*** page, and then testing the ***matches*** page whether it will show the matches of this newly created tournament or not.

## **16.3. *System Testing***

This phase was applied after the end of the system development, in which all the system components and modules are integrated together, and the system is tested as a whole. In this phase, all the previously specified functional requirements are tested using a set of test cases which are shown in detail in the next section.

## **16.4. *Test Cases***

In order to test all the functionalities that Nazamly application provides, a large set of test cases is applied to cover a wide range of possibilities that may happen during using the system. These test cases are grouped below according to the functionality they test.

A detailed description for each test case is provided along with the test result showing the application response in a figure.

#### 16.4.1. *Sign Up*

The sign-up form includes 3 fields for Username, Email, and Password, along with a checkbox for the user to select whether he is a tournament organizer or not.

These fields have some restrictions: the username and email should not be registered previously, the email also should be a valid one, formatted as “[name@example.com](mailto:name@example.com)”, while the password should have minimum length of 6 characters. The password typically can be any mix of lowercase or uppercase alphabet, numbers, or special characters.

Below are all the test cases performed on the sign-up form, along with the application response.

- **Entry of proper data with no violation for restrictions**

When entering proper data in the register page and clicking “Create Account” button, the account will be created and the user will be directed automatically to his profile page, as shown in below figure.

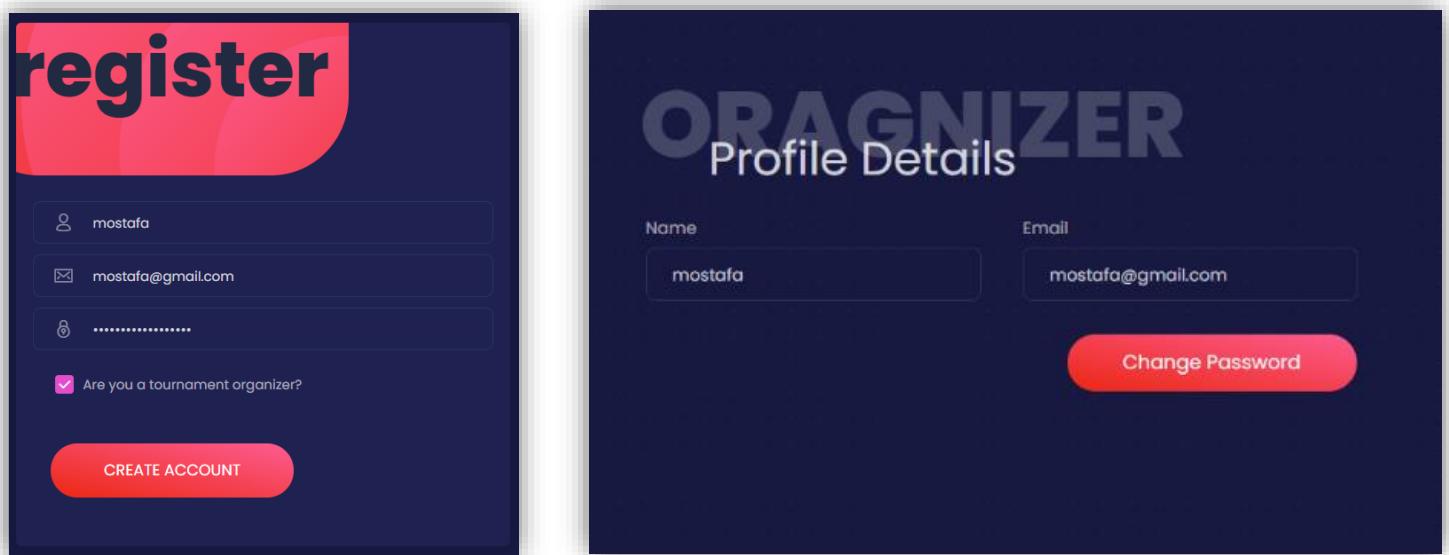

Figure 28: Sign up - Entry of proper data

- Entry of an invalid email

The screenshot shows a registration page with a red header containing the word "register". The form fields are as follows:

- Username: mostafa
- Email: mostafa@gmail.com
- Message: Not an email
- Password: ..... (represented by dots)
- Organizer Checkbox: checked
- Create Account Button: red button labeled "CREATE ACCOUNT"

Figure 29: Sign up - Entry of an invalid email

- Entry of a password with length <6

The screenshot shows a registration page with a red header containing the word "register". The form fields are as follows:

- Username: mostafa
- Email: mostafa@gmail.com
- Message: Passwords need to be 6 characters min
- Password: ..... (represented by dots)
- Organizer Checkbox: checked
- Create Account Button: red button labeled "CREATE ACCOUNT"

Figure 30: Sign up - Entry of a short password

- Entry of an already registered username

The screenshot shows a registration page with a red header containing the word "register". The form fields are as follows:

- Username: mostafa
- Message: UserName already exists
- Email: name@gmail.com
- Password: ..... (represented by dots)
- Organizer Checkbox: checked
- Create Account Button: red button labeled "CREATE ACCOUNT"

Figure 31: Sign up - Entry of a registered username

- Entry of an already registered email

The screenshot shows a registration page with a red header containing the word "register". The form fields are as follows:

- Username: mostafa
- Email: mostafa@gmail.com
- Message: Email already has account
- Password: ..... (represented by dots)
- Organizer Checkbox: checked
- Create Account Button: red button labeled "CREATE ACCOUNT"

Figure 32: Sign up - Entry of a registered email

#### 16.4.2. Sign In

The sign in form simply includes email and password fields. **If a user has already registered for an account, he can enter the email-password pair that with which he registered to login to his account and enjoy the features available to him.**

The user can only log in if he entered a matching pair of email and password. Otherwise, he will be prompted with a **message conveying the problem. The email may be invalid, the password may be short, or the email and password are not matching.**

Below are all the test cases performed on the sign in form, along with the application response.

- **Entry of a correct email and password**

Once the user enters a matching pair of email and password and clicking “Login” button, he is directed automatically to his personalized home page, as shown in these figures.

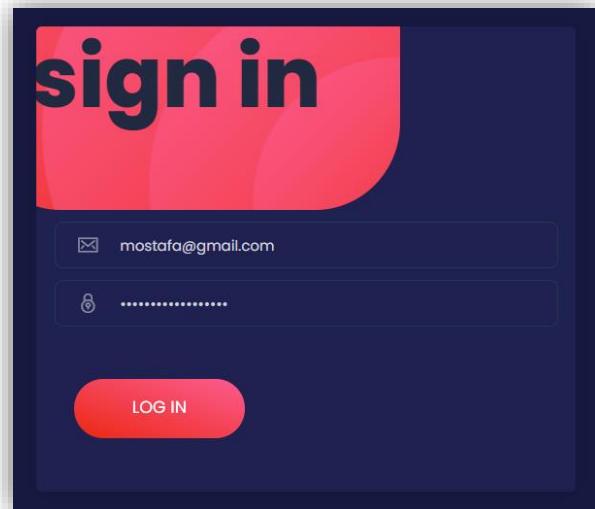

Figure 33: Sign in - Entry of correct email and password

A screenshot of a personalized home screen for the "george" user. The top navigation bar includes links for HOME, ALL MATCHES, STANDINGS, STATS, MANAGE, PROFILE, and LOGOUT. Below the navigation are search bars for Team Name, Tournament Name, and Date (mm/dd/yyyy). The main content area displays three cards representing tournament results for Week 1 (12/27/2021), Week 2 (12/28/2021), and Week 3 (12/29/2021). Each card shows a match between Ismaily and Zamalek, with Mandolin as the third team. The cards include "Score Details" and "Sold Out" buttons. The background is dark blue with some decorative elements.

#### 16.4.3. Create Tournament

Only organizing users are eligible to use the feature of **creating and managing new tournaments**. To create a new tournament, the admin enters some data for his tournament such as name, start and end date, ticket price, no. of tickets/match, and finally he adds all the tournament teams. However, there are some validations and restrictions on these input fields which are shown in the below test cases.

For instance, **the tournament name, start date, and end date fields cannot be left empty**. **The selected end date should - logically - come after the selected start date with at least 1 day in between**. And trivially, **the tournament should have at least 2 participating teams**. **The tournament name cannot be the same as an already existing one**.

Moreover, it is assumed that each team can play at most 1 match in a day, so **the no. of days between the start and end dates should at least equal the no. of tournament rounds or more, i.e., a tournament with n teams should be at least n days long**.

All these test cases are shown below along with the application response to each of them.

- **Adding a name of an already existing tournament**

The screenshot shows a mobile-style interface for creating a tournament. At the top, a red box highlights the 'Tournament Name' field, which contains 'EPL'. Below it are fields for 'Start Date' (01/01/2022) and 'End Date' (02/01/2022). Further down are fields for 'No. of Tickets' (50) and 'Ticket Price' (10000). A note says, 'If there are no tickets to sell just leave the input fields empty'. A large blue button labeled 'Add Teams' is centered. Below it, under 'Teams added:', is a table listing six teams: Liverpool, PSG, Barcelona, Man City, Man United, and Real Madrid, each with a delete 'X' icon. At the bottom is a pink button labeled 'Add Tournament', and a red message box displays the error: 'Tournament Name already exists'.

Team	X
Liverpool	X
PSG	X
Barcelona	X
Man City	X
Man United	X
Real Madrid	X

Figure 39: Create Tournament - Adding an existing tournament name

- **Leaving name or date fields empty**

The screenshot shows the tournament creation form with several fields highlighted in red:

- Tournament Name:** Empty field.
- Start Date:** mm/dd/yyyy field with calendar icon.
- End Date:** mm/dd/yyyy field with calendar icon.
- Number of Days:** 50.
- Number of Seats:** 10000.

Below the form, a message says: "If there are no tickets to sell just leave the input fields empty". A blue "Add Teams" button is present. The "Teams added:" section lists three teams: Man City, Barcelona, and Man United, each with a delete "X" icon. At the bottom, a red message says: "Make sure Name and Date fields are entered".

Figure 40: Create Tournament - Leaving fields empty

- **Selecting end date that go before start date**

The screenshot shows the tournament creation form with the following configuration:

- Tournament Name:** Champion League.
- Start Date:** 01/01/2022.
- End Date:** 12/30/2021.
- Number of Days:** 50.
- Number of Seats:** 10000.

Below the form, a message says: "If there are no tickets to sell just leave the input fields empty". A blue "Add Teams" button is present. The "Teams added:" section lists three teams: Man City, Barcelona, and Man United, each with a delete "X" icon. At the bottom, a red message says: "Start date can't be after End date".

Figure 41: Create Tournament - End date is prior start date

- **Adding no or only 1 team to the tournament**

The screenshot shows the tournament creation form with the following setup:

- Tournament Name:** Champion League.
- Start Date:** 01/01/2022.
- End Date:** 02/01/2022.
- Number of Days:** 50.
- Number of Seats:** 10000.

Below the form, a message says: "If there are no tickets to sell just leave the input fields empty". A blue "Add Teams" button is present. The "Teams added:" section shows a single team: Barcelona, with a delete "X" icon. At the bottom, a red message says: "The Tournament needs at least 2 Teams".

Figure 42: Create Tournament - Adding no or only 1 team

- **Providing a short tournament period (no. of days < no. of teams)**

The screenshot shows the tournament creation form with the following configuration:

- Tournament Name:** Champions Legue.
- Start Date:** 01/01/2022.
- End Date:** 01/05/2022.
- Number of Days:** 50.
- Number of Seats:** 10000.

Below the form, a message says: "If there are no tickets to sell just leave the input fields empty". A blue "Add Teams" button is present. The "Teams added:" section lists five teams: Liverpool, PSG, Barcelona, Man City, and Man United, each with a delete "X" icon. At the bottom, a red message says: "Date difference must be bigger for this number of teams".

Figure 43: Create Tournament - Short tournament period

Typically, the organizer can add any no. of teams to his tournament. The algorithm used to schedule the matches between the tournament teams assumes that the no. of team is even, and equal no of matches are held in each round. Therefore, a tournament with even (N) teams will have (N-1) rounds and  $(N-1)*(N/2)$  matches.

However, if the user added odd no. of teams to the tournament, the application adjusts the algorithm slightly in order to for each team to have played the same no. of matches at the end of tournament. In this case, one team will be left out and don't play a match in each round. Therefore, a tournament with odd (N) teams will have (N) rounds and  $(N/2)*(N-1)$  matches.

Two more test cases for these 2 possibilities are given below.

- **Creating tournament with EVEN no. of teams**

In this test case, a tournament with 6 teams is created as shown below. For all teams to face each other, the tournament should have 5 rounds and a total of 15 matches which are indeed created as shown in the below figure.

The screenshot shows a mobile application interface for creating a tournament. At the top, there are input fields for the tournament name ('Champions League'), start date ('01/01/2022'), end date ('02/01/2022'), and ticket prices ('100' and '50000'). Below these fields is a note: 'If there are no tickets to sell just leave the input fields empty'. A large blue button labeled 'Add Teams' is centered. Underneath it, a section titled 'Teams added:' lists six teams: Liverpool, PSG, Barcelona, Man City, Man United, and Real Madrid, each followed by a delete icon (an 'X'). At the bottom is a large red button labeled 'Add Tournament'.

Figure 44: Create tournament - EVEN no. of teams

These are the 15 matches created for the EVEN tournament:

Figure 45: Created matches for EVEN no. of teams

- **Creating tournament with ODD no. of teams**

In this test case, a tournament with 5 teams is created as shown below. For all teams to face each other, the tournament should have 5 rounds and a total of 10 matches which are indeed created as shown in the next page.

The screenshot shows a user interface for creating a tournament. At the top, there's a field labeled "Europa League". Below it are two date inputs: "01/01/2022" and "02/01/2022", each with a calendar icon. Underneath the dates are two input fields: "50" and "50000". A note below the fields says, "If there are no tickets to sell just leave the input fields empty". In the center is a blue button labeled "Add Teams". Below the button, the text "Teams added:" is followed by a list of five teams: Liverpool, PSG, Man City, Barcelona, and Real Madrid, each with a red "X" icon to their right. At the bottom is a large red button labeled "Add Tournament".

#### 16.4.4. View Matches

This feature is available for all types of users: organizers, registered, or anonymous. They can access their favorite teams' and favorite tournaments' matches through "Home" tab, or they can view all available matches through "All Matches" tab.

Displayed matches can be made more focused by using one of the three filters at the top of the page: Team Name, Tournament Name, and Date. With the first, the user can view all matches for a specific team, while the second filter can display all matches in a specific tournament, and finally the date filter shows all the matches that are gonna be played in the picked date.

Initially, as figure .. shows, all available upcoming matches for all teams in any tournaments are displayed with no filters. Using filters, they are reduced to match only the applied filters, as shown in the upcoming 3 test cases.

Week 2 1/7/2022	Week 1 1/1/2022	Week 2 1/7/2022

- Example Tournament** (Week 3, 1/1/2022): No specific teams listed. Buttons: Score Details, Buy Tickets.

Figure 51: Filter matches by Date

#### 16.4.5. Buy Tickets

One of the features that are available to users is to buy match tickets, which can be accessed by clicking the “Buy Tickets” button displayed on any match card. The user can buy one or more tickets with two payment options: Cash payment and Credit Card payment. Once the order is confirmed, a pdf receipt will be automatically available for the user to download.

However, there is a limit for the no. of available tickets for a match which is specified from the organizer when creating the tournament.

When buying tickets, it is eligible if the ordered tickets don't exceed the available ones. Otherwise, a message will be displayed showing the available no. of tickets.

Moreover, if all the match tickets are sold out or there are no tickets originally for this match (the tournament organizer can specify this), the “Buy Tickets” button will show “Sold out” instead.

Some test cases for all these possibilities are provided below.

- Entry of available no. of tickets

The screenshot shows a mobile application interface for buying tickets. At the top, a large red header says "tickets". Below it, the text "Select Side:" is followed by two radio buttons: one selected for "Liverpool" and one for "Real Madrid". Underneath, "Select Number of tickets:" is displayed next to a text input field containing the number "2". The "Ticket Price: 100" is shown above the input field. Below the input field, "Total to pay: 200" is displayed. Under "Select Payment Method:", there are two radio buttons: one selected for "Cash Payment" and one for "Card Payment". At the bottom is a large red button labeled "Confirm Purchase".

Figure 53: Buy Tickets - Entry of available no. of tickets

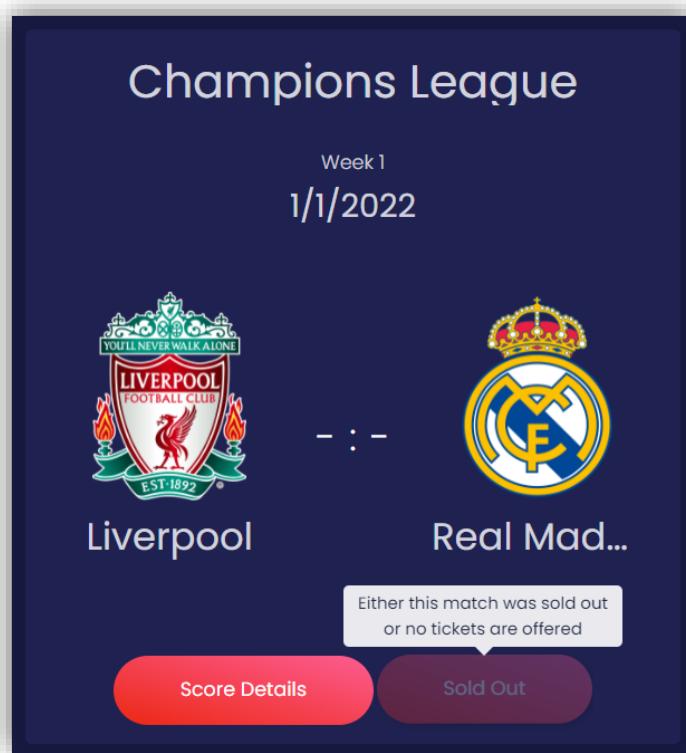

Figure 55: Buy Tickets - No available tickets

## **17. Estimated Project Cost**

The Function Point method is used in the process of cost estimation of this project. It is used as it depends mainly on the detailed specification of the program user interface and hence producing a nearly accurate estimate for the cost of program development. The user input, output, and inquiry screens of the UI; the database files; and interfaces with external systems are counted; then each one is assigned with the appropriate complexity as the below table indicates. Based on this, the Unadjusted Function Point (UFC) is calculated as shown below.

*Table 1: Measurement Parameters Details*

Parameter	Parameter Elements	Complexity
<b>User Input Screens</b>	1- New Account Registration	Simple
	2- Log in	Simple
	3- Manage Profile	Simple
	4- Buy Tickets	Average
	5- Create New Tournament	Complex
	6- Update Match Result	Complex
<b>User Output Screens</b>	1- Reset Password Alert	Simple
	2- Bought Tickets Report	Simple
	3- Sales Report	Average
<b>User Inquiries Screens</b>	1- Default Home Screen	Simple
	2- Personalized Home Screen	Average
	3- All Matches	Average
	4- League Standings	Complex
	5- Players Statistics	Complex
<b>Database Files</b>	1- Users File	Simple
	2- Admins File	Simple
	3- Tickets File	Simple
	4- Players File	Simple
	5- Teams File	Average
	6- Matches File	Average
	7- Tournaments File	Complex
<b>External Interfaces</b>	1- External Bank Database	Simple
	2- Email Service API	Average

## 17.1. Unadjusted Function Point Calculation

Table 2: Unadjusted Function Point

Measurement	Count			Weighting Factor			Sum	
	Parameter	Simple	Average	Complex	Simple	Average	Complex	
Number of User Inputs		3	2	1	3	4	6	23
Number of User Outputs		2	1	---	4	5	7	13
Number of User Inquiries		1	2	2	3	4	6	23
Number of Files		4	2	1	7	10	15	63
Number of External Interfaces		1	1	---	5	7	10	12
Unadjusted Function Point (UFC) count							134	

## 17.2. Complexity Factor Ratings

Table 3: Complexity Factor

i	Complexity Factor	Rate/F (0-5)
1	Backup and recovery	1
2	Data communication	5
3	Distributed processing functions	3
4	Is performance critical?	4
5	Existing operating environment	3
6	On-line data entry	5
7	Input transaction built over multiple screens	0
8	Master files updated on-line	5
9	Complexity of inputs, outputs, files, inquiries	3
10	Complexity of processing	3
11	Code design for re-use	2
12	Are conversion/installation included in design?	0
13	Multiple installations	1
14	Application designed to facilitate change by the user	5
<b>Total Count</b>		<b>40</b>

**Adjusted FP Calculation:**

$$FP = UFC * \left( 0.65 + 0.01 * \sum_{i=1}^{14} F_i \right)$$

$$FP = 134 * (0.65 + 0.01 * 40) = 134 * 1.05 \cong 141$$

### **1.1.LOC Calculation:**

Since the software will be developed mainly using JavaScript, and HTML the expected number of Lines Of Code (LOC) is calculated as follows, considering JavaScript has an average LOC/FP of 53, and HTML has 40 LOC/FP averaging 46.5.

$$\text{Expected LOC} = FP * \left( \frac{LOC}{FP} \right) = 141 * 46.5 = 6556 = 6.556 KLOC$$

### **1.2.Effort & Time Calculation Using CoCoMo Model:**

Nazamly software application can be classified as an organic type as the team size required is adequately small, the problem is well understood and has been solved in the past, and also the team members have a nominal experience regarding the problem. Hence, the values for the constants that will be used in calculations are:

$$a = 2.4, \quad b = 1.05$$

The Basic COCOMO Model can be used for quick and slightly rough calculations of Nazamly software costs by estimating required effort and time as follows:

$$\text{Effort} = a * (KLOC)^b = 2.4 * (6.556)^{1.05} = 17.33 \text{ Person/Month}$$

The time required for developing the software is about 2 months.

$$\text{Persons Required} = \frac{\text{Effort}}{\text{Time}} = \frac{17.33}{2} \cong 9 \text{ Persons}$$

Finally, an approximate estimate for the project cost can be calculated by assuming an average salary of 15,000 L.E./Person.

$$\text{Total Cost} = 9 * 15000 = 135,000 \text{ L.E.}$$

## **18. USER GUIDE**

### **18.1. *Getting Started***

This is your first time using the Nazamly webapp, an application that offers a solution to you if you need to follow matches results of the teams you would love to see.

The system can be used anonymously or while logged into your free-to-create Nazamly account for a personalized experience and some extra features.

Starting the application for the first time will open to the default home screen in the following figure.

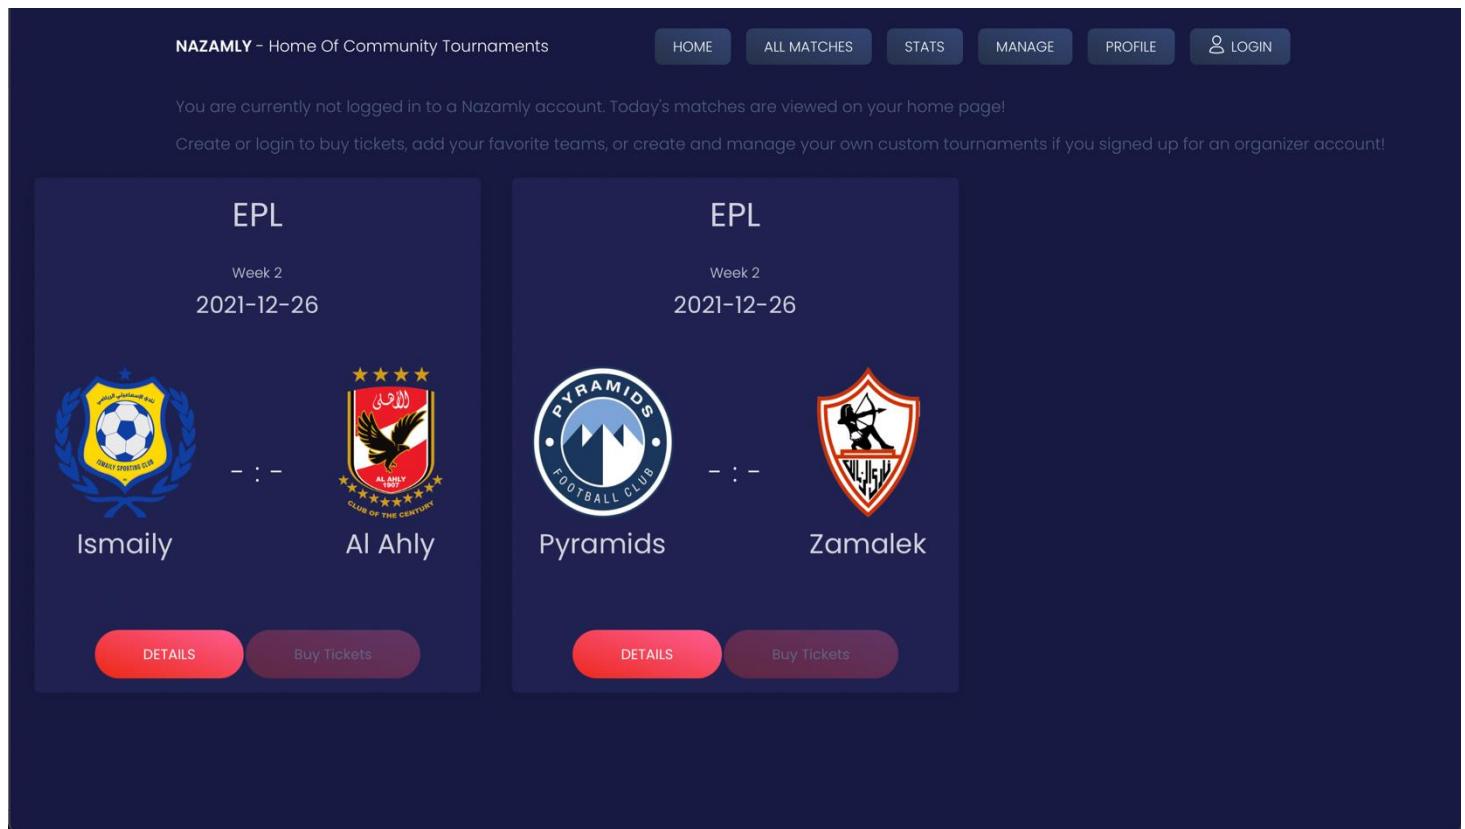

Figure 56: Getting Started

### **18.1.1. Creating a new Nazamly account**

It is highly recommended to create a new free-to-create Nazamly account, which is a very simple operation where you will have your own account within a few steps.

- 1- Press on the “Login” button on the top right of your home screen.

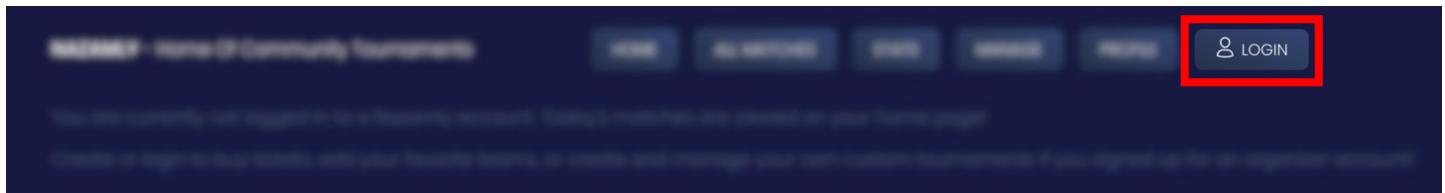

Figure 57: Login Button

- 2- Fill in your personal information in the “register” box as follows, name, email, a password that is not shorter than 6 letters long, and only check the last checkbox if you are a tournament organizer or willing to be one.

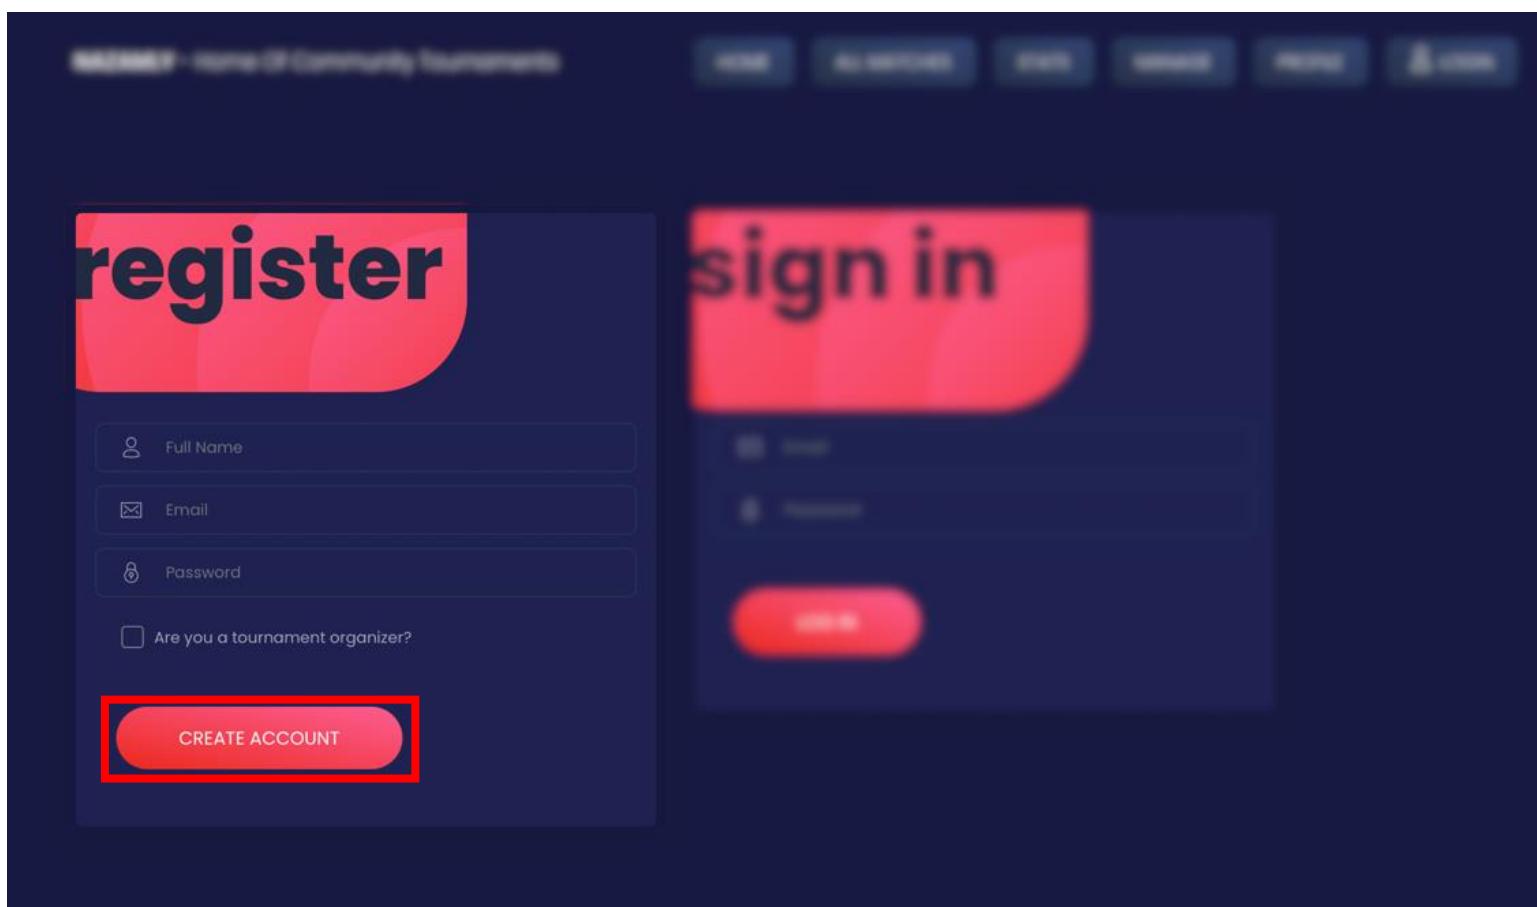

Figure 58: Register new account

- 3- Press the “CREATE ACCOUNT” button.

### **18.1.2. Logging into your Nazamly account**

When you sign in to your Nazamly account, you start your very own customized experience.

- 1- Fill in your account credentials in the “sign in” including the email you used in creating your account and your account password.
- 2- Press the “LOG IN” button.

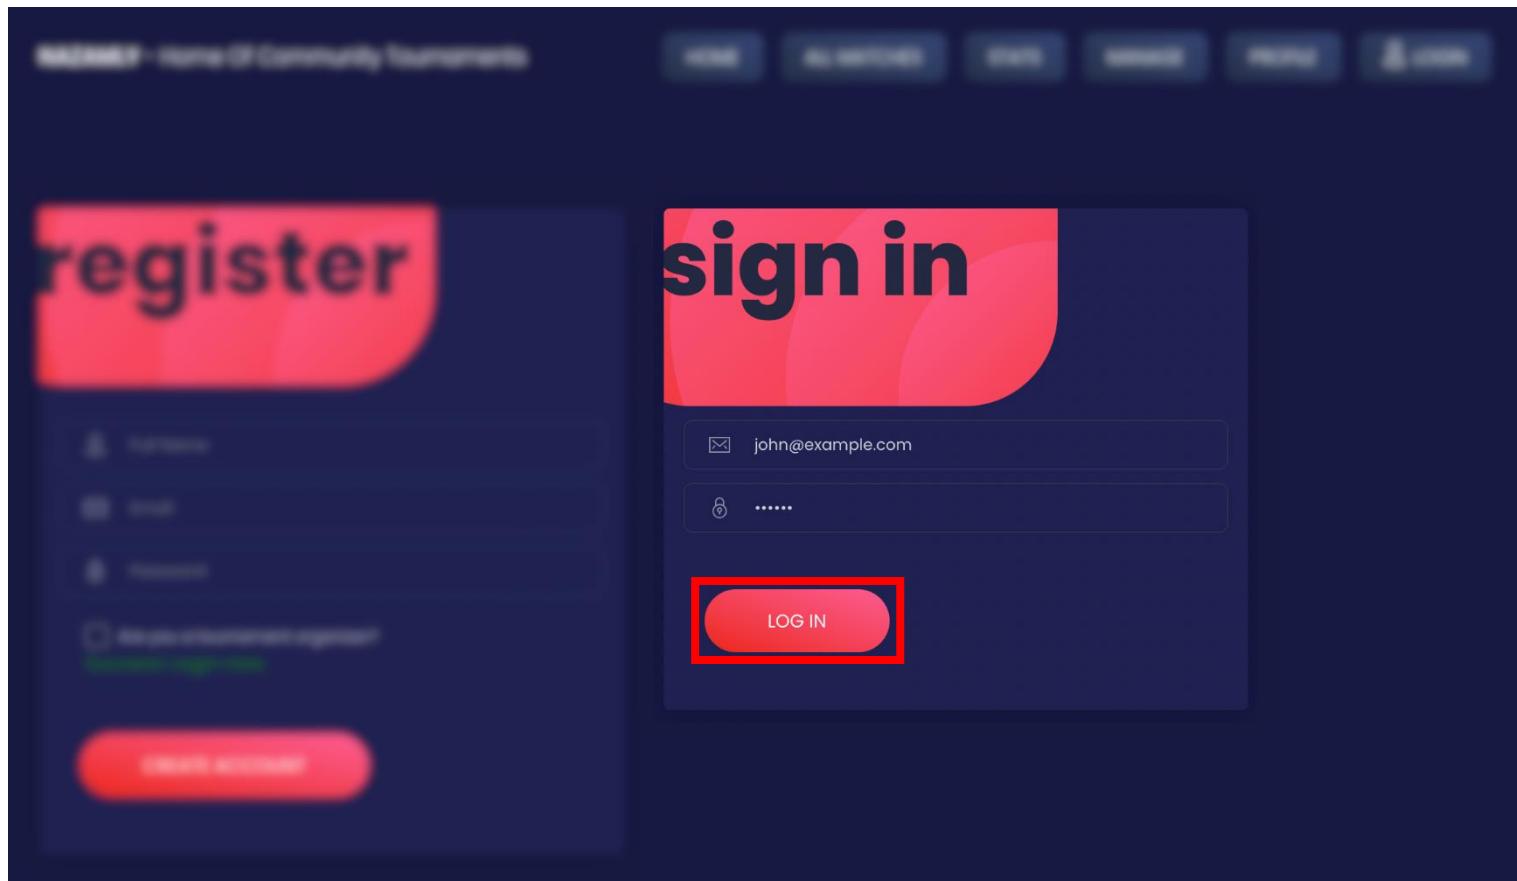

Figure 59: Log in

- 3- You will be redirected if your credentials were correct.

## 18.2. *Browsing Nazamly tabs*

Nazamly webapp has a lot of features to help you enjoy your sports following experience to the max. These features are divided between 6 tabs on the top of your screen.

### 18.2.1. *All matches*

This tab includes all the matches available for viewing through Nazamly, organized in match cards that include the tournament name, match date, opponents' names, and the match final score if it was played. Today's matches are the one available by default to view, while you can filter view the match cards by 3 different filters, available in the top of your screen.

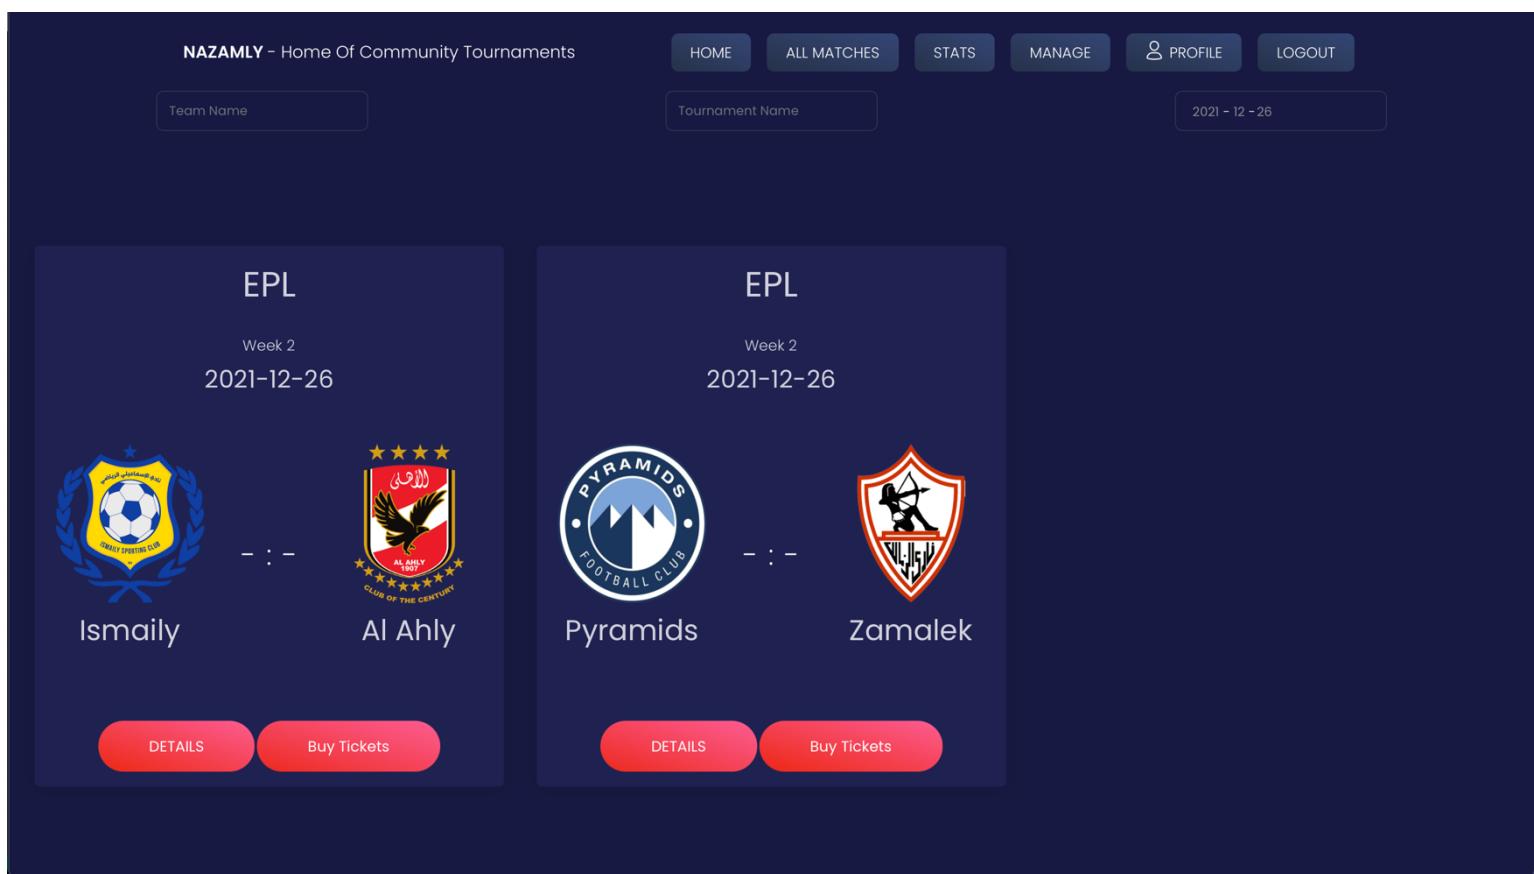

Figure 60: Default All Matches Tab

## 1- Filter by Tournament

A search bar that allows you to view matches of one of any of the available tournaments through Nazamly.

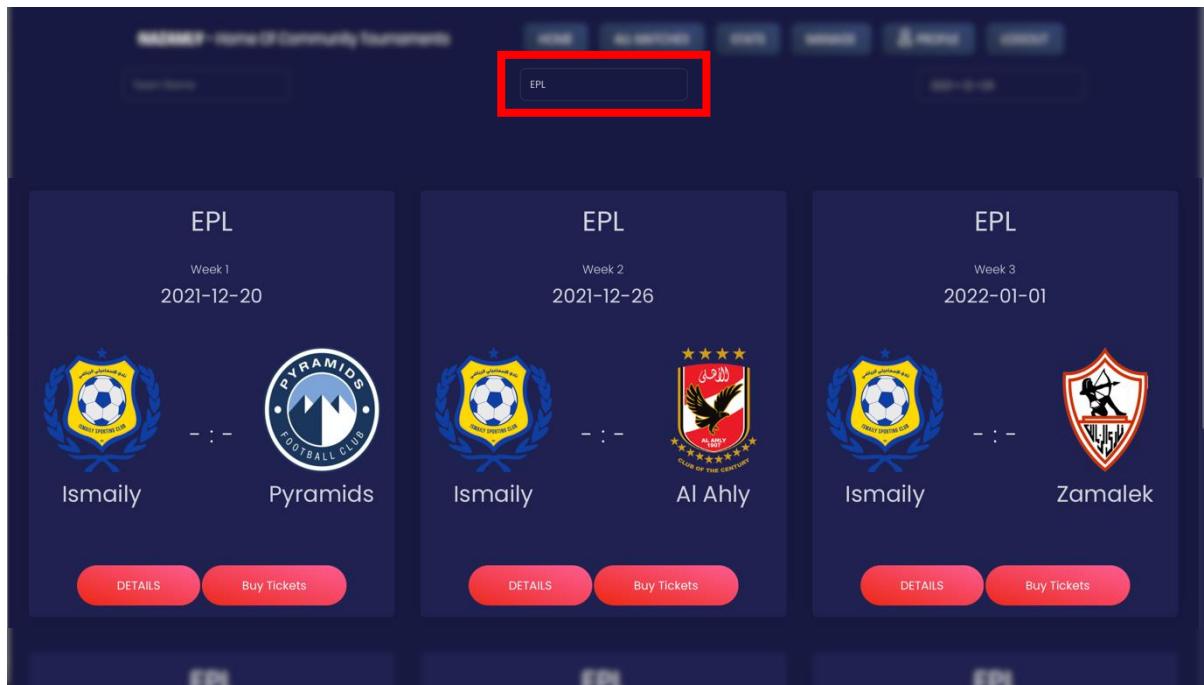

Figure 61: Filter by Tournament

## 2- Filter by Team

A search bar that allows you to view matches of one of any of the available teams.

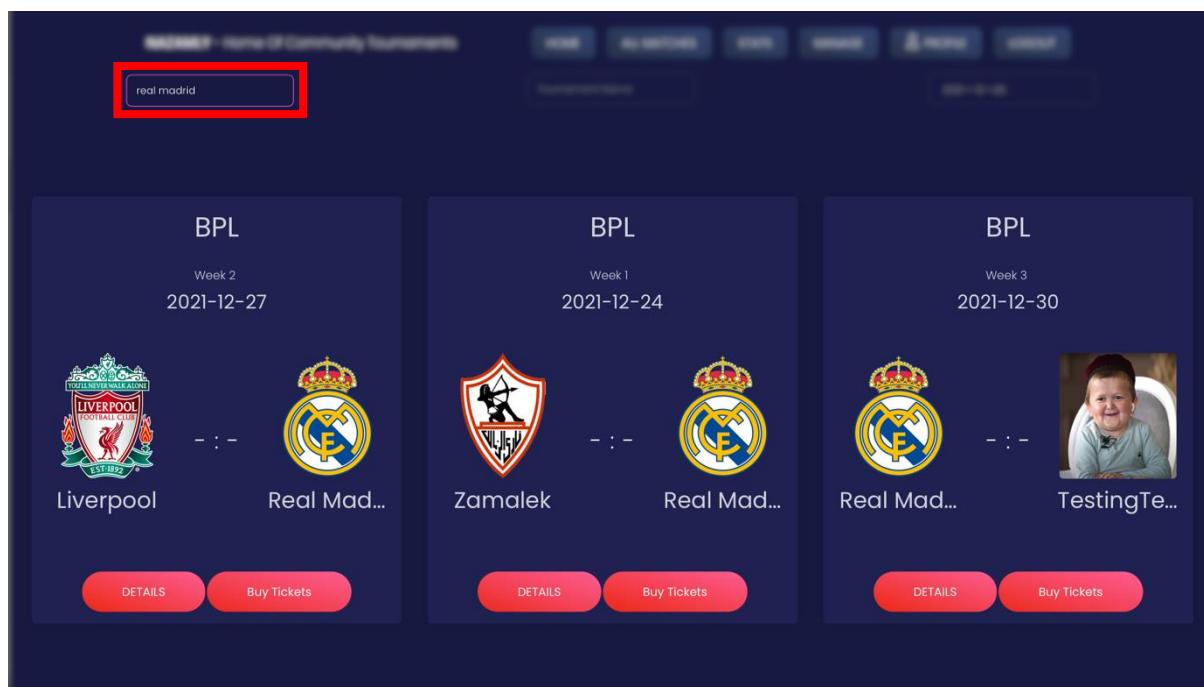

Figure 62: Filter by Team

### 3- Filter by Date

Choose whatever day that you want to view matches that were played or will be played on from an easy-to-use date-picker.

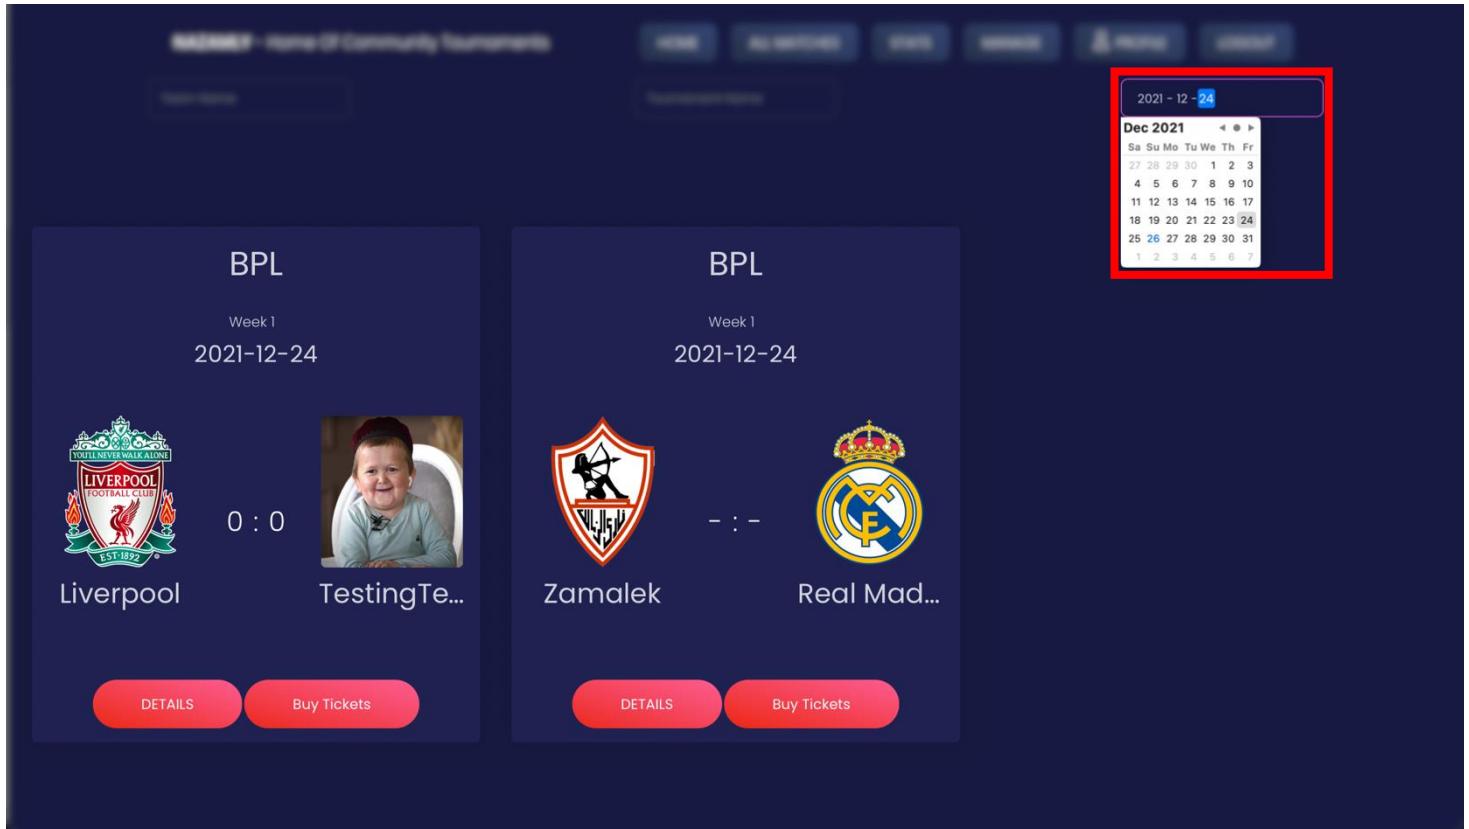

Figure 63: Filter by Date

### 18.2.2. Buying Tickets

This feature is only available if you are logged into your free-to-create Nazamly account.

On both “All Matches” and “Home” tabs, you can find a “Buy Ticket” button on any of the match cards that will enable you to buy this specific match tickets paying in cash or using your card.

- 1- Press the “Buy ticket” button on any match card.

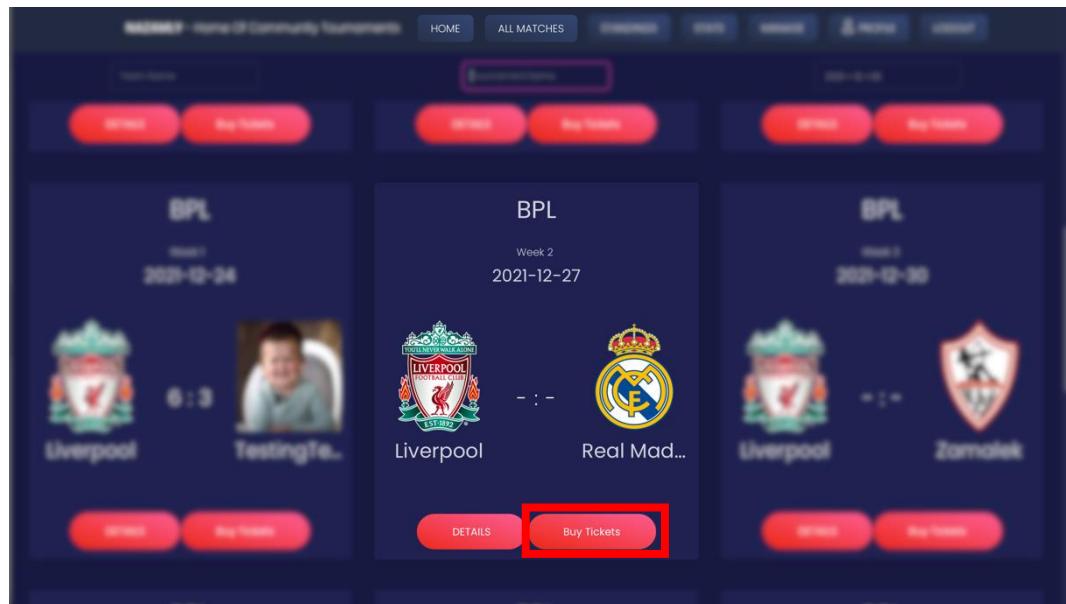

Figure 64: Buy Tickets Button

- 2- Choose the team, number of tickets and choose payment method. Confirm & review your purchase to pay and download your tickets as a PDF e-ticket.

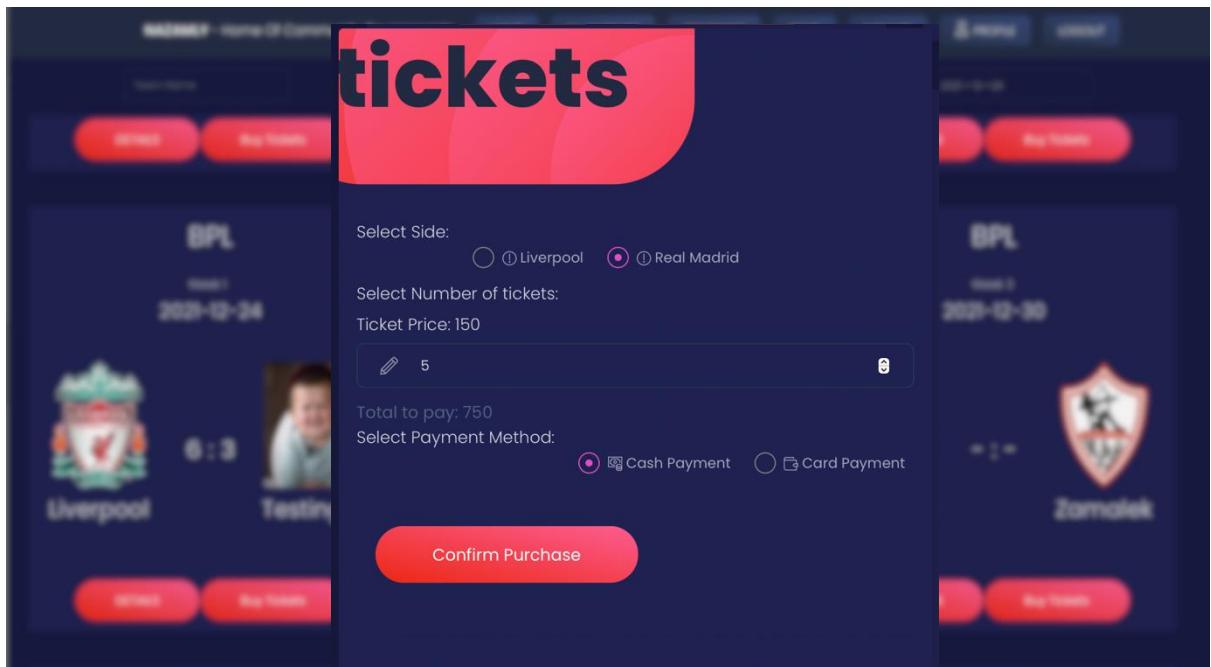

Figure 65: Tickets Cash Purchase

- 3- If you chose card payment you will have to fill in your card number, CVV, and card expiry date in order to pay.

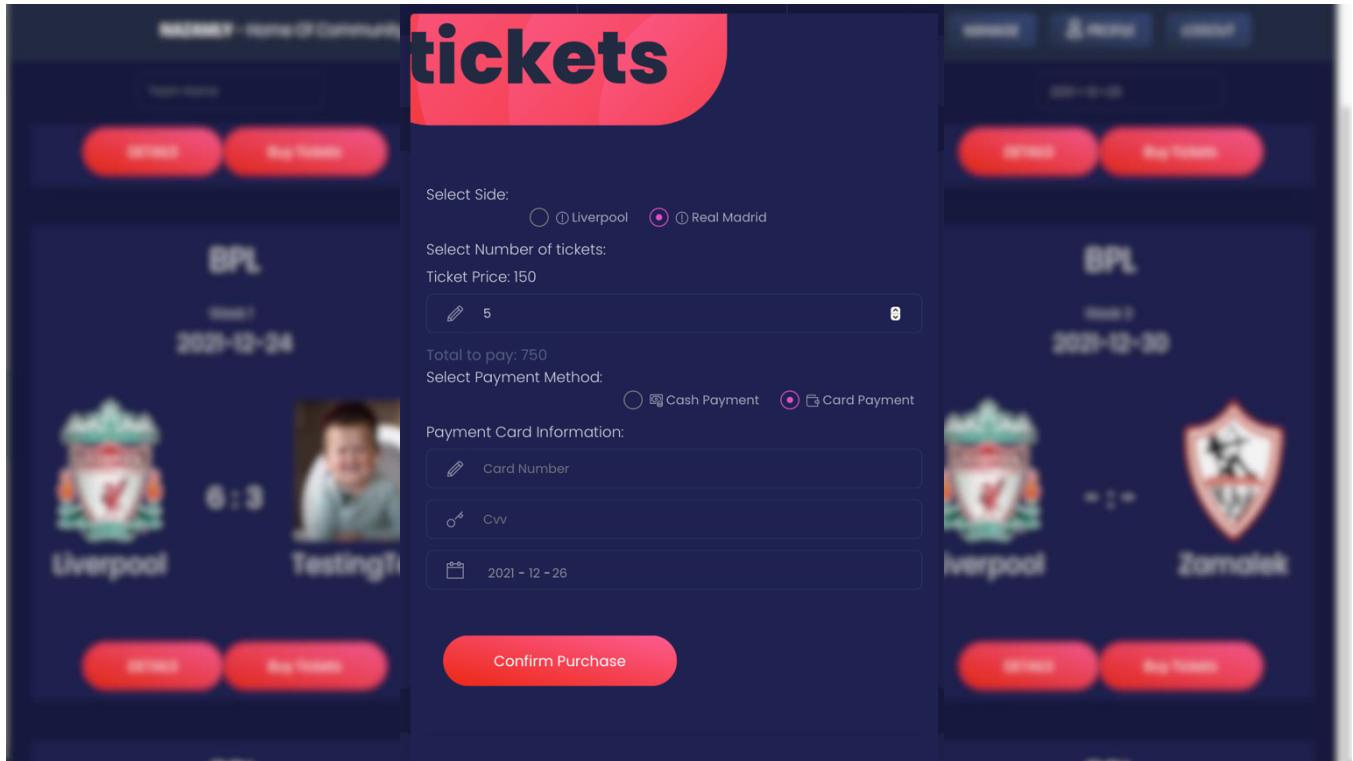

Figure 66: Tickets Card Purchase

- 4- A PDF formatted file will be downloaded containing your e-ticket as follows.

### 18.2.3. *Standings*

This tab includes the standings of all the tournaments available for viewing through Nazamly organized in table view. You can choose a tournament to view its standings and you can sort the tournament's teams through several sort options.

The table view is initially empty until you choose a tournament.

Rank	Team	Played	Pts	GF	GA	GD

Figure 68: Standings Initial View

#### 1- Choose a Tournament

A drop-down menu allows you to choose from the tournaments' name list to view its standings in table view. Each row displays a team record including all its details.

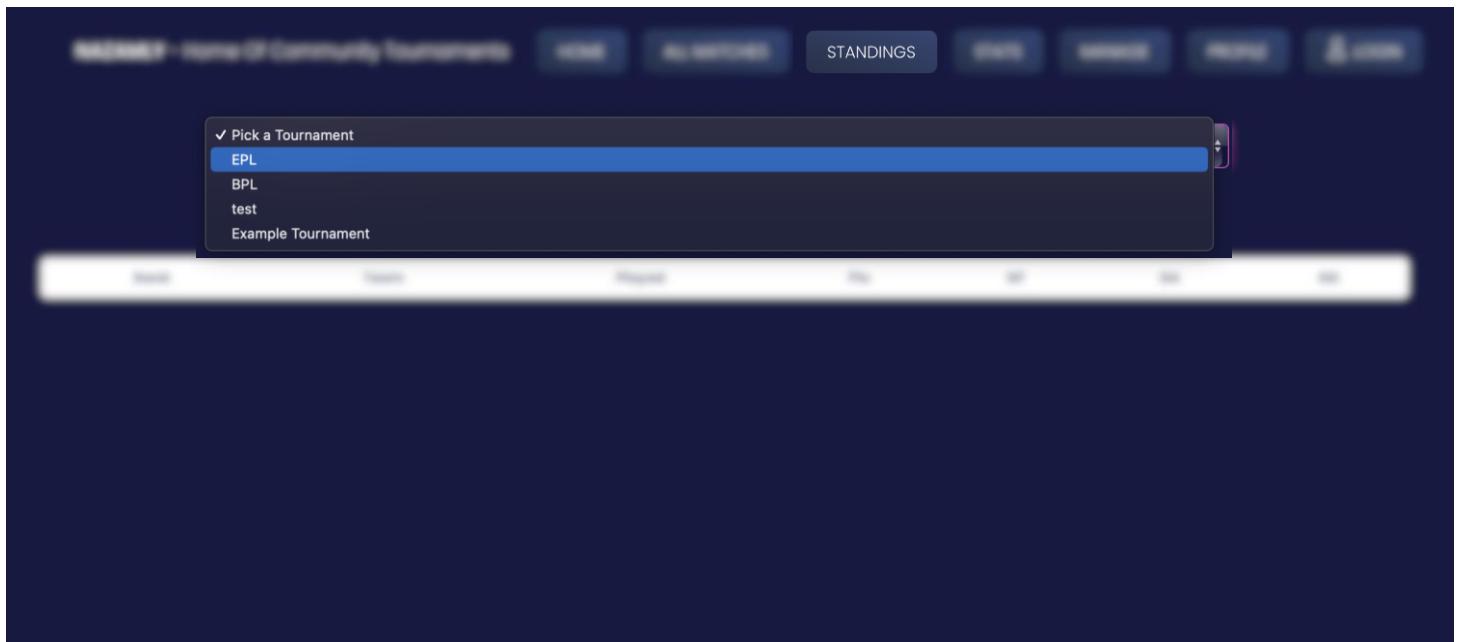

Figure 69: Choose Tournament Drop-down

## 2- Sort by Attribute

You can press on any of the table columns heads to sort the teams according to that attribute, ascending or descending. An example of descending sorting teams according to their league rank would be as in figure.

The screenshot shows the NAZAMLY app interface. At the top, there is a navigation bar with links: HOME, ALL MATCHES, STANDINGS, STATS, MANAGE, PROFILE, and LOGIN. Below the navigation bar, a dropdown menu is open, showing the option 'BPL'. The main content area displays a table titled 'STANDINGS' for the BPL. The table has the following columns: Rank, Team, Played, Pts, GF, GA, and GD. The data is sorted in descending order of rank:

Rank	Team	Played	Pts	GF	GA	GD
4	TestingTeam 1	1	0	3	6	-3
3	Zamalek	1	0	4	5	-1
2	Real Madrid	1	3	5	4	1
1	Liverpool	1	3	6	3	3

Figure 70: Sorting Standings Table

#### 18.2.4. *Statistics*

This tab features the player statistics of all tournaments available through Nazamly. The page is initially empty with a dropdown menu to choose a tournament to view its scorers.

- 1- Choose a tournament from the dropdown menu.
- 2- Sort ascendingly and discerningly by pressing on the table headers.

Player Name	Team	Goals
Mo Salah	Liverpool	6
Hasbula	TestingTeam1	3
Bencharki	Zamalek	3
Benzema	Real Madrid	3
Shikabala	Zamalek	1
Alaba	Real Madrid	1
Vini Jr	Real Madrid	1
"/>

### 18.2.5. **Profile Page**

This tab helps you customize your Nazamly experience as much as possible where you can add, remove favorite teams, view your account details, and change your account password.

- 1- To change your password, press “Change Password” button.

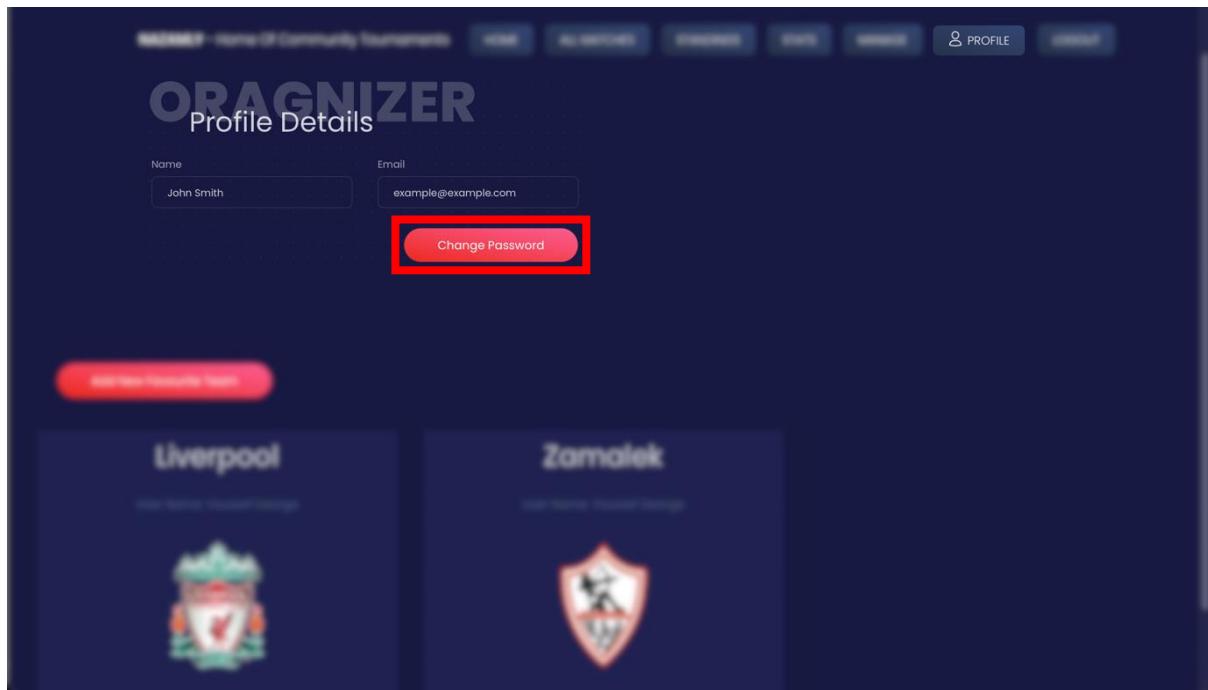

Figure 71: Profile Page

- 2- Enter your current password in addition to your new password, and submit.

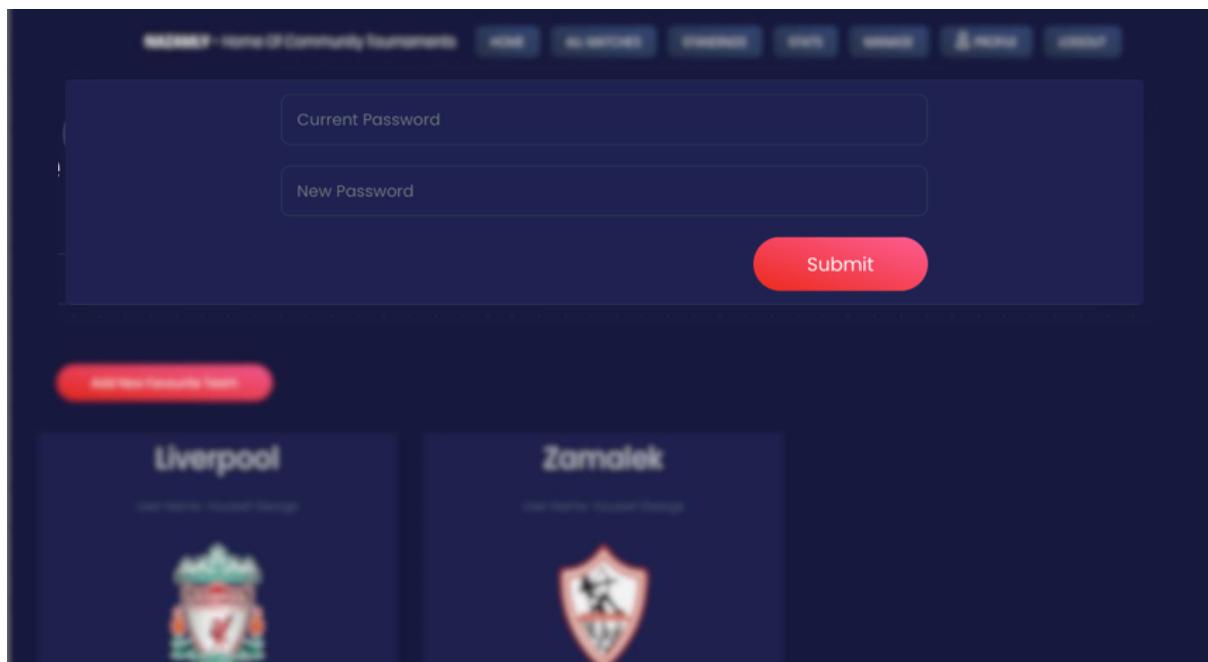

Figure 72: Changing your Password

1- To add to your favorite teams, press the “Add New Favourite Team” button.

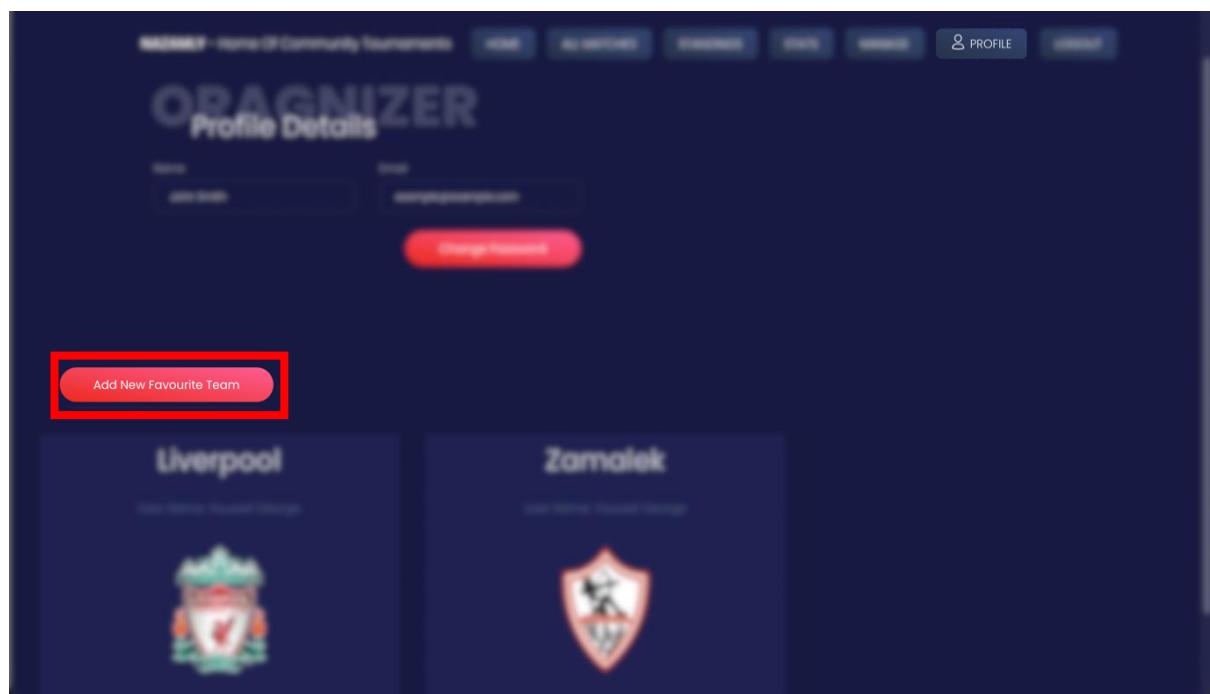

Figure 73: Add Favorite Team

2- Press the “Add” button on any number of teams to add to your favourite teams list.

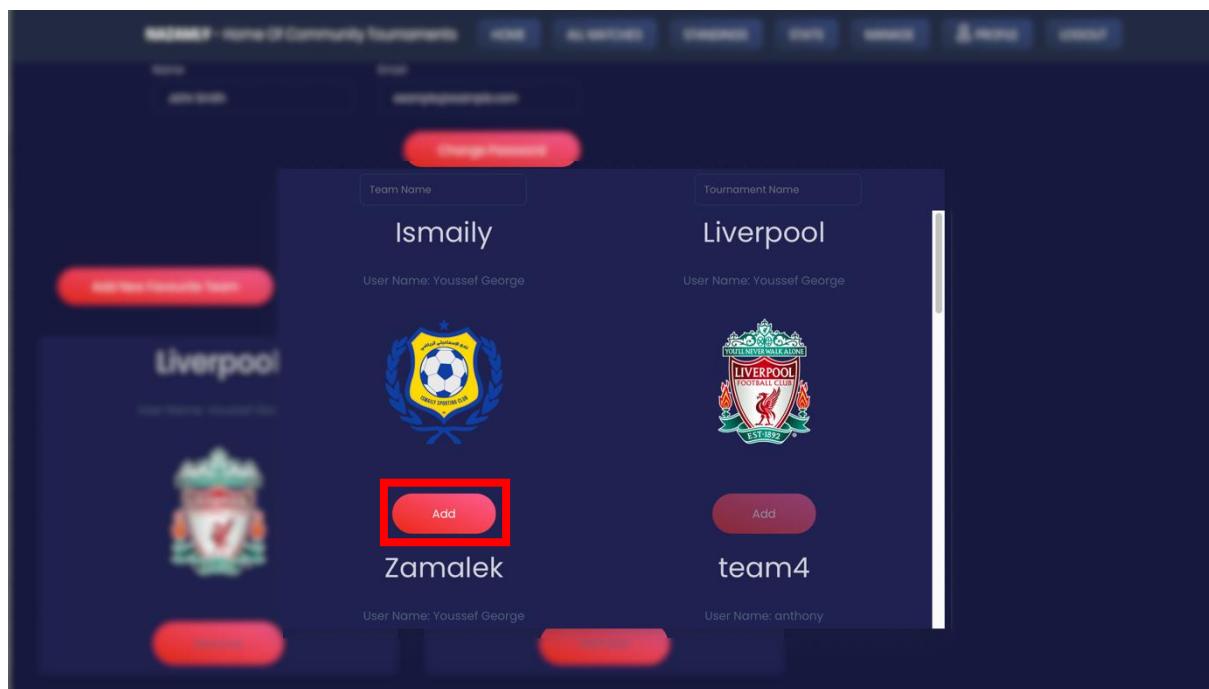

Figure 74: Add Favourite Teams Modal

## **18.3. Organizers-Only Features**

As an organizer, you will have administrative and organizational features in the “Manage” tab where you can add teams, create a new tournament, update its matches’ final score, provide goal scorers’ names, and get a sales report of your tournaments’ tickets.

### **18.3.1. Adding new team**

- 1- Press “Add Team” button on the top left of your page.

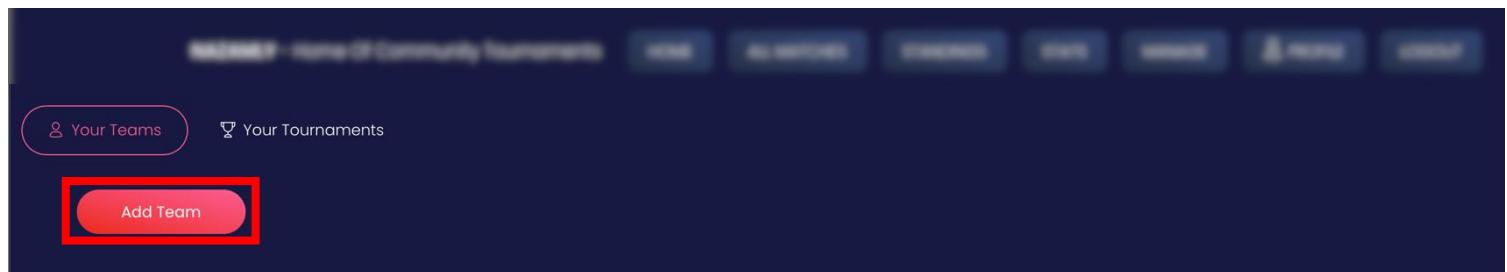

Figure 75: Add New Team

- 2- Enter the new team’s name and upload the team crest/ logo (optional).

A screenshot of the 'New Team Information' form. On the left, there's a large red button labeled 'Add Team'. In the center, there's a form area. The first input field is labeled 'Team Name' and contains the text 'Best Team', which is also highlighted with a red border. Below this is a placeholder image of a soccer ball. Underneath the ball is a file input field labeled 'Choose File' with the file name 'Sports-Ball-Transparent.png'. Below the file input is a blue rectangular button labeled 'Upload', which is also highlighted with a red border. To the right of the 'Upload' button is a smaller red button labeled 'Submit'.

Figure 76: New Team Information

- 3- Once submitted, new team is added to Nazamly and you can view and edit your teams information from “Your Teams” sub-tab as shown.

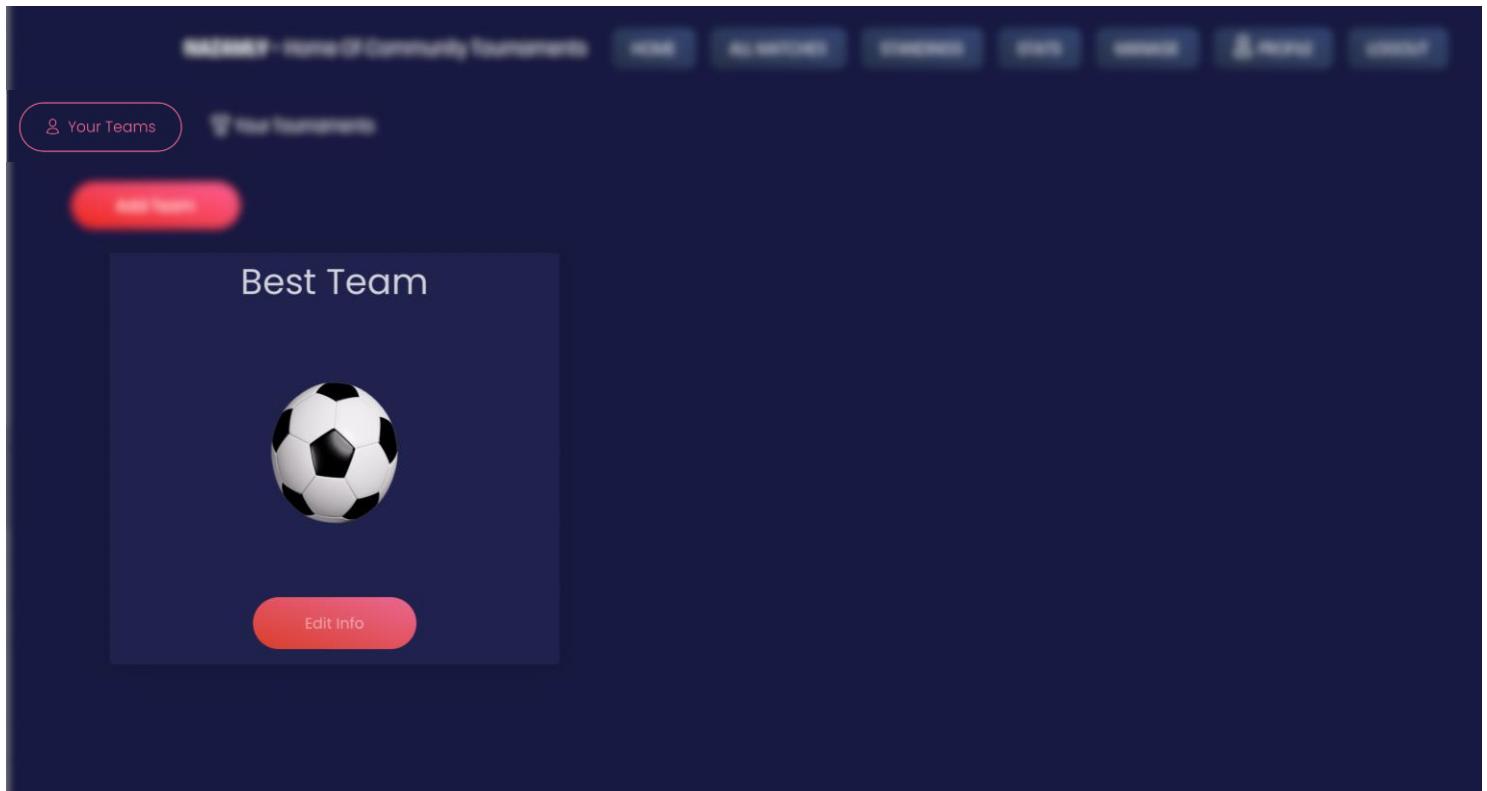

Figure 77: View your teams

#### 18.3.2. **Create New Custom Tournament**

- 1- Press “New Tournament” button under “Your Tournaments” sub-tab.

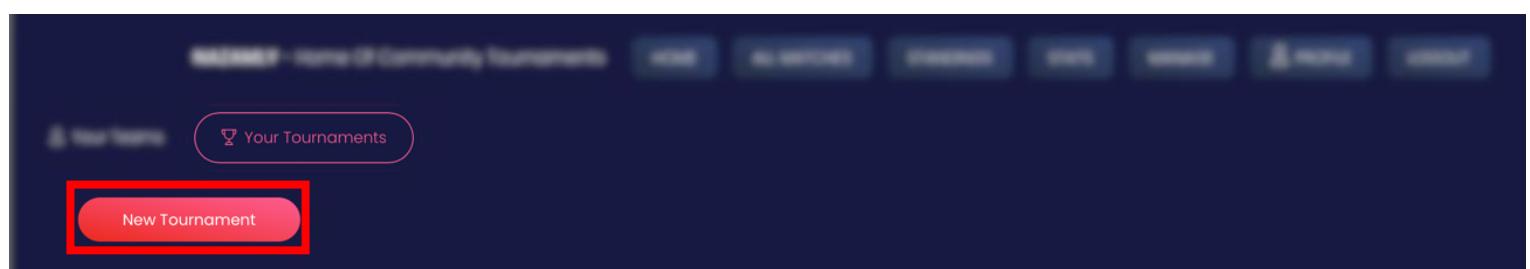

Figure 78: New Tournament Button

- 2- Fill in tournament's name, teams, start date, end date, number of tickets available per match, and ticket price.

The screenshot shows a dark-themed web interface for creating a new tournament. At the top, there is a navigation bar with several tabs: 'HOME', 'ALL MATCHES', 'UPCOMING', 'PAST', 'RESULTS', 'SCHEDULE', 'LEAGUE', and 'TURNOVERS'. Below the navigation bar, there are two buttons: 'Your Teams' (disabled) and 'New Tournament' (highlighted with a red border). A large red button labeled 'New Tournament!' is positioned below these buttons. The main form area has a light blue background and contains the following fields:

- Tournament Name
- Date Range: 2021 - 12 - 26 to 2021 - 12 - 26
- Price per Ticket: 0
- Ticket per Match: 0

A note below the fields says: "If there are no tickets to sell just leave the input fields empty". There is a blue button labeled "Add Teams" and a red button labeled "Add Tournament". Below the "Add Teams" button, it says "Teams added: [empty list]".

Figure 79: Create New Tournament

- 3- League matches are auto-generated and added to the matches list according to your start and end date.

### 18.3.3. *Update Match Result*

After creating your custom tournament with the auto-generated matches schedule, you shall be able to update the match results for your tournament's fans to view.

- 1- On the “Manage” tab, under the “Your Tournaments” sub-tab, you will be able to see a horizontal list of your tournaments where you can press any of them to view your tournament matches before updating its score.

The screenshot shows the NAZAMLY platform interface. At the top, there is a navigation bar with links: HOME, ALL MATCHES, STANDINGS, STATS, MANAGE, PROFILE, and LOGOUT. Below the navigation bar, there are two main sections: 'Your Teams' and 'Your Tournaments'. The 'Your Tournaments' section is highlighted with a red box around its title. Under 'Your Tournaments', there are two entries: 'New Tournament' and 'Example Tournament'. The 'Example Tournament' entry is also highlighted with a red box around its title. Below each tournament entry, there is a preview of a match. The first match is between 'Best Team' (represented by a soccer ball icon) and 'Pyramids' (represented by a logo with the text 'PYRAMIDS FOOTBALL CLUB'). The second match is between 'team3' (represented by a shield icon with 'TEAM') and 'team4' (represented by a shield icon with 'TEAM'). Each match preview includes a 'Sales Details' button and an 'Edit Details' button, which is also highlighted with a red box.

Figure 80: Your Tournaments

- 2- Pressing “Edit Details” button allows you to add the number of goals for each team in addition to optionally adding the goal scorer name of each goal.

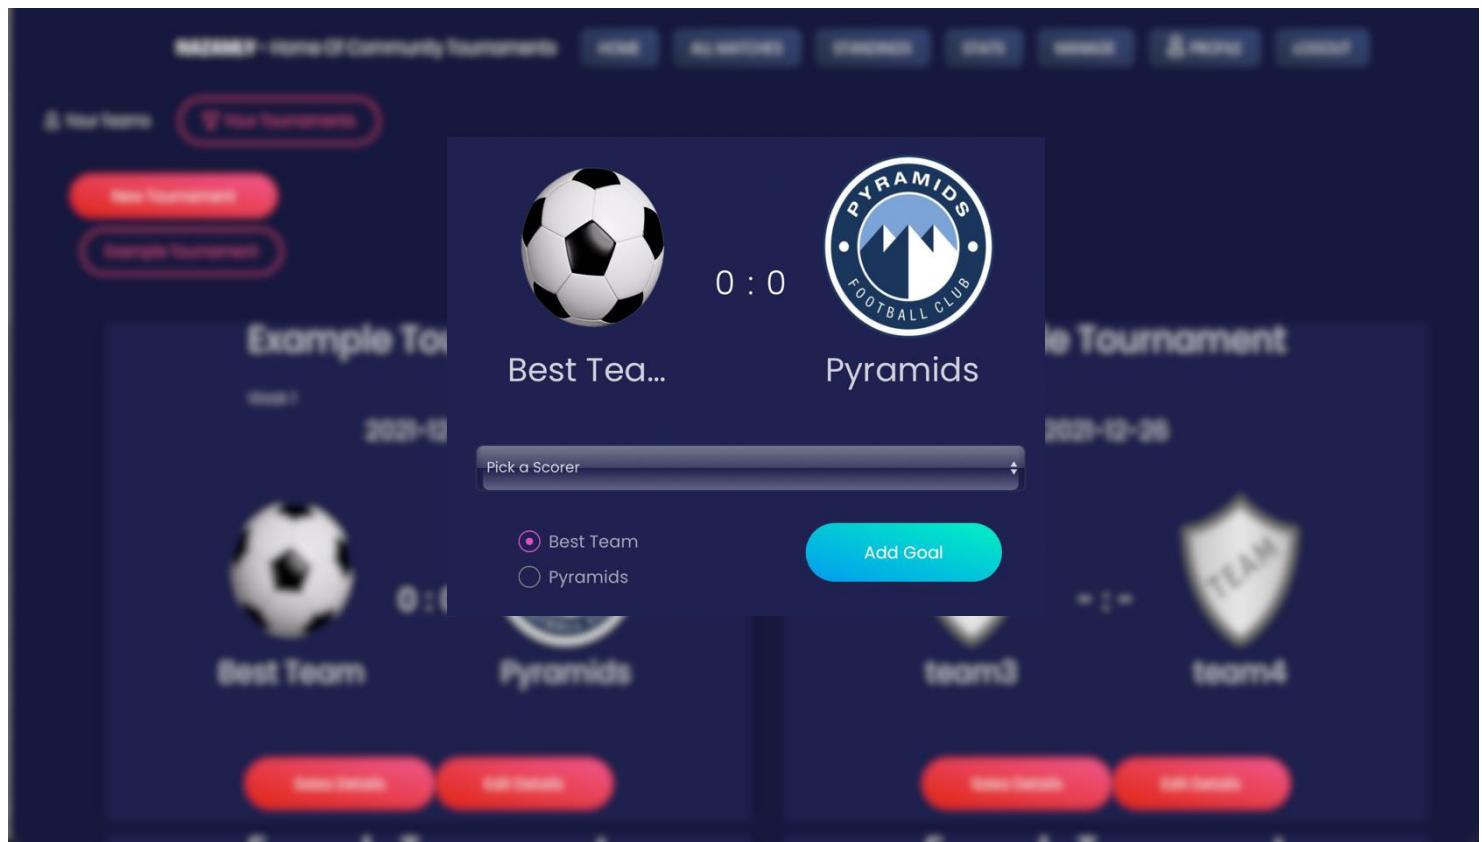

Figure 81: Update Match Result

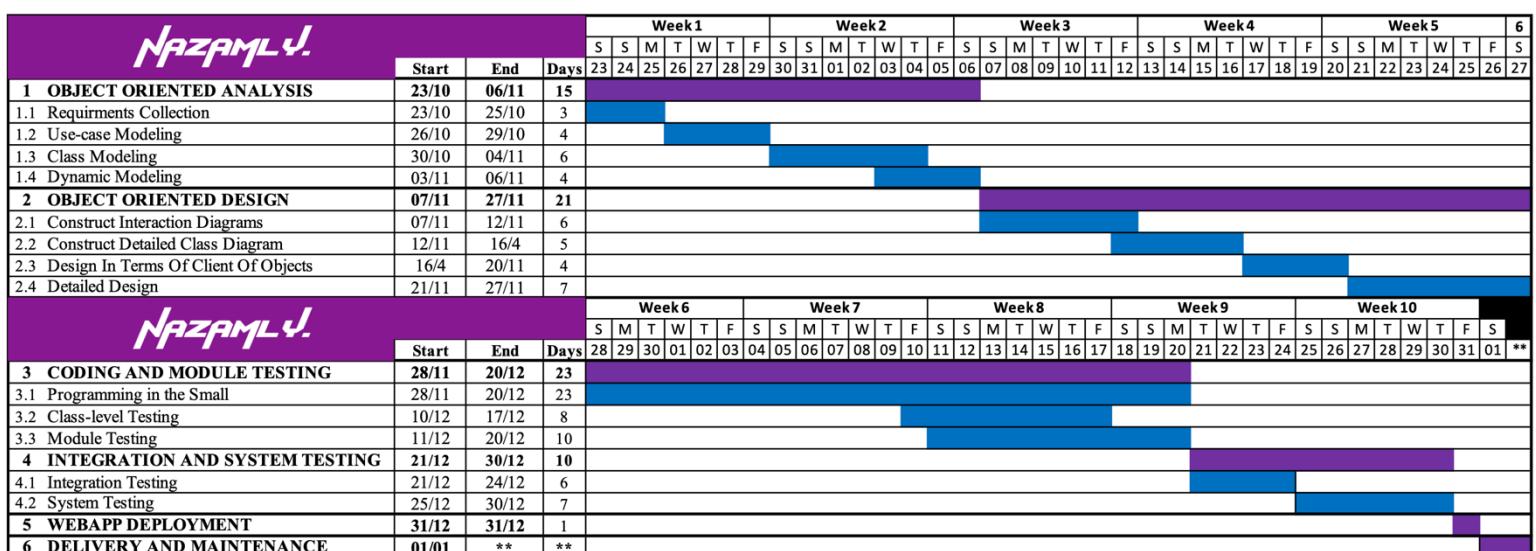

## **19. Time Plan**

The project will be developed in a waterfall process model, a document driven model, where each phase will be completed to move onto the next phase.

There are 5 phases that will take place. These include an analysis phase, a design phase, a coding and module testing phase, and integration and system testing phase and finally, deployment, delivery, and maintenance phase.

The project will be developed over a 10-week period divided among the phases starting on the 23<sup>rd</sup> of October 2021 to the 31<sup>st</sup> of December of the same year.

Details of the time plan is furtherly described in the Gantt chart provided in the figure below.

*Figure 82: Nazamly Gantt Chart*
